MIC2550

Universal Serial Bus Transceiver

Advance Information

General Description

The MIC2550 is a single-chip transceiver that complies with the physical layer specifications for Universal Serial Bus (USB).

The MIC2550 supports full-speed (12Mb/s) and low-speed (1.5Mb/s) operation. It operates down to 2.5V for compatiblity with the lower system voltages typical of mobile systems.

Features

- Compliant to *USB Specification Revision 1.1*
- Operation down to 2.5V
- Supports high-speed (12Mb/s) and low-speed (1.5Mb/s) operation
- Speed-select termination supply
- Very low power consumption meets USB suspend-current requirements
- Small 14-pin TSSOP

Applications

- Personal digital assistants (PDA)
- Palmtop computers
- Cellular telephones

Pin Description

Pin Number	Pin Name	Pin Function
1	VIF	System Interface Supply Voltage (Input): Determines logic voltage levels for system interface signaling to logic controller.
2	SPD	Speed (Input): Edge rate control. Logic high selects full-speed edge rates. Logic low selects low-speed edge rates.
3	RCV	Receive Data (Output): System interface receive data interface to logic controller.
4	VP	Plus (Input/Output): System interface signal to logic controller. If OE# is logic 1, VP is a receiver output (+); If OE# is logic 0, VP is a driver input (+).
5	VM	Minus (Input/Output): System interface signal to logic controller. If OE# is logic 1, VM is a receiver output (–); If OE# is logic 0, VM is a driver input (–).
6, 13	NC	not internally connected
7	GND	Ground: Power supply return and signal reference.
8	SUS	Suspend (Input): Logic high turns off internal circuits to reduce supply current.
9	OE#	Output Enable (Input): Active-low system interface input signal from from logic controller. Logic low causes transceiver to transmit data onto the bus. Logic high causes the transceiver to receive data from the bus.
10	D–	USB Differential Data Line – (Input/Output)
11	D+	USB Differential Data Line + (Input/Output)
12	VTRM	Termination Supply (Output): 3.3V speed termination resistor supply output.
14	VBUS	USB Supply Voltage (Input): Transceiver supply.

Applications Information

The MIC2550 is designed to provide USB connectivity in mobile systems where system supply voltages are not available to satisfy USB requirements. The MIC2550 can operate down to supply voltages of 2.5V and still meet USB physical layer specifications. As shown in the circuit below, the MIC2550 takes advantage of USB's supply voltage, V_{BUS}, to operate the transceiver. The system voltage, V_{IF}, is used to set the reference voltage used by the digital I/O lines (VP, VM, RCV, OE#, SPD, and SUS pins) interfacing to the system. Internal circuitry provides translation between the USB and system voltage domains. V_{IF} will typically be the main supply voltage rail for the system.

In addition, a 3.3V, 10% termination supply voltage, V_{TERM}, is provided to support speed selection. A 1.5K resistor is required to be connected between this pin and the D+ or D- lines to respectively specify high speed or low speed operation.

Suspend

When the suspend pin (SUS) is high, power consumption is reducted to a minimum. V_{TERM} is not disabled.

External ESD Protection

The use of ESD transient protection devices is not required for operation, but is recommended.
