
Table of Contents

Chapter 0: Front Matter	1
Dedication	1
Introduction	1
Who is this book for?	2
Chapter summaries	3
The project	4
Acknowledgements	5
Contact us	6
Chapter 1: Linking and Loading	7
What do linkers and loaders do?	7
Address binding: a historical perspective	7
Linking vs. loading	10
Two-pass linking	12
Object code libraries	15
Relocation and code modification	17
Compiler Drivers	18
Linker command languages	19
Linking: a true-life example	20
Exercises	25
Chapter 2: Architectural Issues	27
Application Binary Interfaces	27
Memory Addresses	28
Byte Order and Alignment	28
Address formation	30
Instruction formats	31
Procedure Calls and Addressability	32
Procedure calls	33

Data and instruction references	36
IBM 370	37
SPARC	40
SPARC V8	40
SPARC V9	42
Intel x86	43
Paging and Virtual Memory	45
The program address space	48
Mapped files	49
Shared libraries and programs	51
Position-independent code	51
Intel 386 Segmentation	53
Embedded architectures	55
Address space quirks	56
Non-uniform memory	56
Memory alignment	57
Exercises	57
Chapter 3: Object Files	59
What goes into an object file?	59
Designing an object format	60
The null object format: MS-DOS .COM files	61
Code sections: Unix a.out files	61
a.out headers	64
Interactions with virtual memory	65
Relocation: MS-DOS EXE files	72
Symbols and relocation	74
Relocatable a.out	75
Relocation entries	78
Symbols and strings	80
a.out summary	82
Unix ELF	82
Relocatable files	85
ELF executable files	92
ELF summary	94

IBM 360 object format	94
ESD records	95
TXT records	97
RLD records	97
END records	98
Summary	98
Microsoft Portable Executable format	99
PE special sections	105
Running a PE executable	107
PE and COFF	107
PE summary	108
Intel/Microsoft OMF files	108
OMF records	110
Details of an OMF file	111
Summary of OMF	114
Comparison of object formats	114
Project	115
Exercises	117

Chapter 4: Storage allocation 119

Segments and addresses	119
Simple storage layout	120
Multiple segment types	121
Segment and page alignment	124
Common blocks and other special segments	125
Common	125
C++ duplicate removal	127
Initializers and finalizers	130
IBM pseudo-registers	131
Special tables	134
X86 segmented storage allocation	134
Linker control scripts	136
Embedded system storage allocation	138
Storage allocation in practice	138
Storage allocation in Unix a.out linkers	139

Storage allocation in ELF	141
Storage allocation in Windows linkers	144
Exercises	146
Project	147
Chapter 5: Symbol management	149
Binding and name resolution	149
Symbol table formats	150
Module tables	153
Global symbol table	154
Symbol resolution	157
Special symbols	158
Name mangling	158
Simple C and Fortran name mangling	158
C++ type encoding: types and scopes	160
Link-time type checking	163
Weak external and other kinds of symbols	164
Maintaining debugging information	164
Line number information	164
Symbol and variable information	165
Practical issues	166
Exercises	167
Project	167
Chapter 6: Libraries	169
Purpose of libraries	169
Library formats	169
Using the operating system	169
Unix and Windows Archive files	170
Unix archives	170
Extension to 64 bits	174
Intel OMF libraries	174
Creating libraries	176
Searching libraries	177

Performance issues	179
Weak external symbols	179
Exercises	181
Project	181
Chapter 7: Relocation	183
Hardware and software relocation	183
Link time and load time relocation	184
Symbol and segment relocation	185
Symbol lookups	186
Basic relocation techniques	186
Instruction relocation	188
X86 instruction relocation	189
SPARC instruction relocation	189
ECOFF segment relocation	191
ELF relocation	193
OMF relocation	193
Relinkable and relocatable output formats	194
Other relocation formats	194
Chained references	195
Bit maps	195
Special segments	196
Relocation special cases	197
Exercises	197
Project	198
Chapter 8: Loading and overlays	201
Basic loading	201
Basic loading, with relocation	202
Position-independent code	203
TSS/360 position independent code	203
Per-routine pointer tables	206
Table of Contents	207
ELF position independent code	208

PIC costs and benefits	212
Bootstrap loading	213
Tree structured overlays	214
Defining overlays	217
Implementation of overlays	220
Overlay fine points	222
Data	222
Duplicated code	222
Multiple regions	223
Overlay summary	223
Exercises	223
Project	224
Chapter 9: Shared libraries	227
Binding time	230
Shared libraries in practice	231
Address space management	231
Structure of shared libraries	232
Creating shared libraries	233
Creating the jump table	234
Creating the shared library	235
Creating the stub library	235
Version naming	237
Linking with shared libraries	238
Running with shared libraries	238
The malloc hack, and other shared library problems	240
Exercises	243
Project	244
Chapter 10: Dynamic Linking and Loading	247
ELF dynamic linking	248
Contents of an ELF file	248
Loading a dynamically linked program	253
Starting the dynamic linker	253

Finding the libraries	254
Shared library initialization	255
Lazy procedure linkage with the PLT	256
Other peculiarities of dynamic linking	258
Static initializations	258
Library versions	259
Dynamic loading at runtime	260
Microsoft Dynamic Link Libraries	260
Imported and exported symbols in PE files	261
Lazy binding	266
DLLs and threads	267
OSF/1 pseudo-static shared libraries	267
Making shared libraries fast	268
Comparison of dynamic linking approaches	270
Exercises	271
Project	271

Chapter 11: Advanced techniques 273

Techniques for C++	273
Trial linking	274
Duplicate code elimination	276
Database approaches	278
Incremental linking and relinking	278
Link time garbage collection	281
Link time optimization	282
Link time code generation	284
Link-time profiling and instrumentation	284
Link time assembler	285
Load time code generation	285
The Java linking model	287
Loading Java classes	288
Exercises	290
Project	291

Chapter 12: References	293
Perl books	295
