Corrections, suggestions, contributions and translations are welcome!

Best viewed with...

This document is best viewed with a recent PDF reader or with OpenOffice.org itself!

- ▶ Take advantage of internal or external hyperlinks. So, don't hesitate to click on them!
- ▶ Find pages quickly thanks to automatic search
- ▶ Use thumbnails to navigate in the document in a quick way

If you're reading a paper or HTML copy, you should get your copy in PDF or OpenOffice.org format on <http://free-electrons.com/training/drivers!>

Course prerequisites

Skills to make these lectures and labs profitable

Familiarity with Unix concepts and its command line interface

- ▶ Essential to manipulate sources and files
- ▶ Essential to understand and debug the system that you build
- ▶ You should read http://free-electrons.com/training/intro_unix_linux
This Unix command line interface training also explains Unix concepts not repeated in this document.

Experience with C programming

- ▶ On-line C courses can be found on
<http://dmoz.org/Computers/Programming/Languages/C/Tutorials/>

Contents (1)

Introduction

- ▶ Linux features
- ▶ Linux versioning scheme and development process
- ▶ Legal issues: licensing constraints, software patents
- ▶ Kernel user interface

Contents (2)

Compiling and booting

- ▶ Getting the sources
- ▶ Structure of source files
- ▶ Kernel source managers
- ▶ Kernel configuration
- ▶ Compiling the kernel
- ▶ Booting and system startup
- ▶ Linux device files
- ▶ Cross-compiling the kernel

Contents (3)

Basic driver development

- ▶ A simple module
- ▶ Module parameters
- ▶ Adding sources to the tree

Driver development

- ▶ Memory management
- ▶ I/O memory and ports
- ▶ Character drivers
- ▶ Debugging
- ▶ Handling concurrency
- ▶ Sleeping, Interrupt management
- ▶ mmap, DMA

Contents (4)

Driver development

- ▶ New device model, sysfs
- ▶ Hotplug
- ▶ udev dynamic devices

Advice and resources

- ▶ Root filesystem on NFS
- ▶ Choosing filesystems
- ▶ Getting help and contributions
- ▶ Bug report and patch submission
- ▶ References
- ▶ Last advice

Contents (5)

Annexes

- ▶ Using Ethernet over USB
- ▶ Init runlevels

Embedded Linux driver development

Introduction
Linux features

Studied kernel version: 2.6

Linux 2.4

- Mature
- But developments stopped; very few developers willing to help.
- Now obsolete and lacks recent features.
- Still fine if you get your sources, tools and support from commercial Linux vendors.

Linux 2.6

- 2 years old stable Linux release!
- Support from the Linux development community and all commercial vendors.
- Now mature and more exhaustive. Most drivers upgraded.
- Cutting edge features and increased performance.

Linux kernel key features

- ▶ Portability and hardware support
Runs on most architectures.
- ▶ Scalability
Can run on super computers as well as on tiny devices (4 MB of RAM is enough).
- ▶ Compliance to standards and interoperability.
- ▶ Exhaustive networking support.
- ▶ Security
It can't hide its flaws. Its code is reviewed by many experts.
- ▶ Stability and reliability.
- ▶ Modularity
Can include only what a system needs even at run time.
- ▶ Easy to program
You can learn from existing code. Many useful resources on the net.

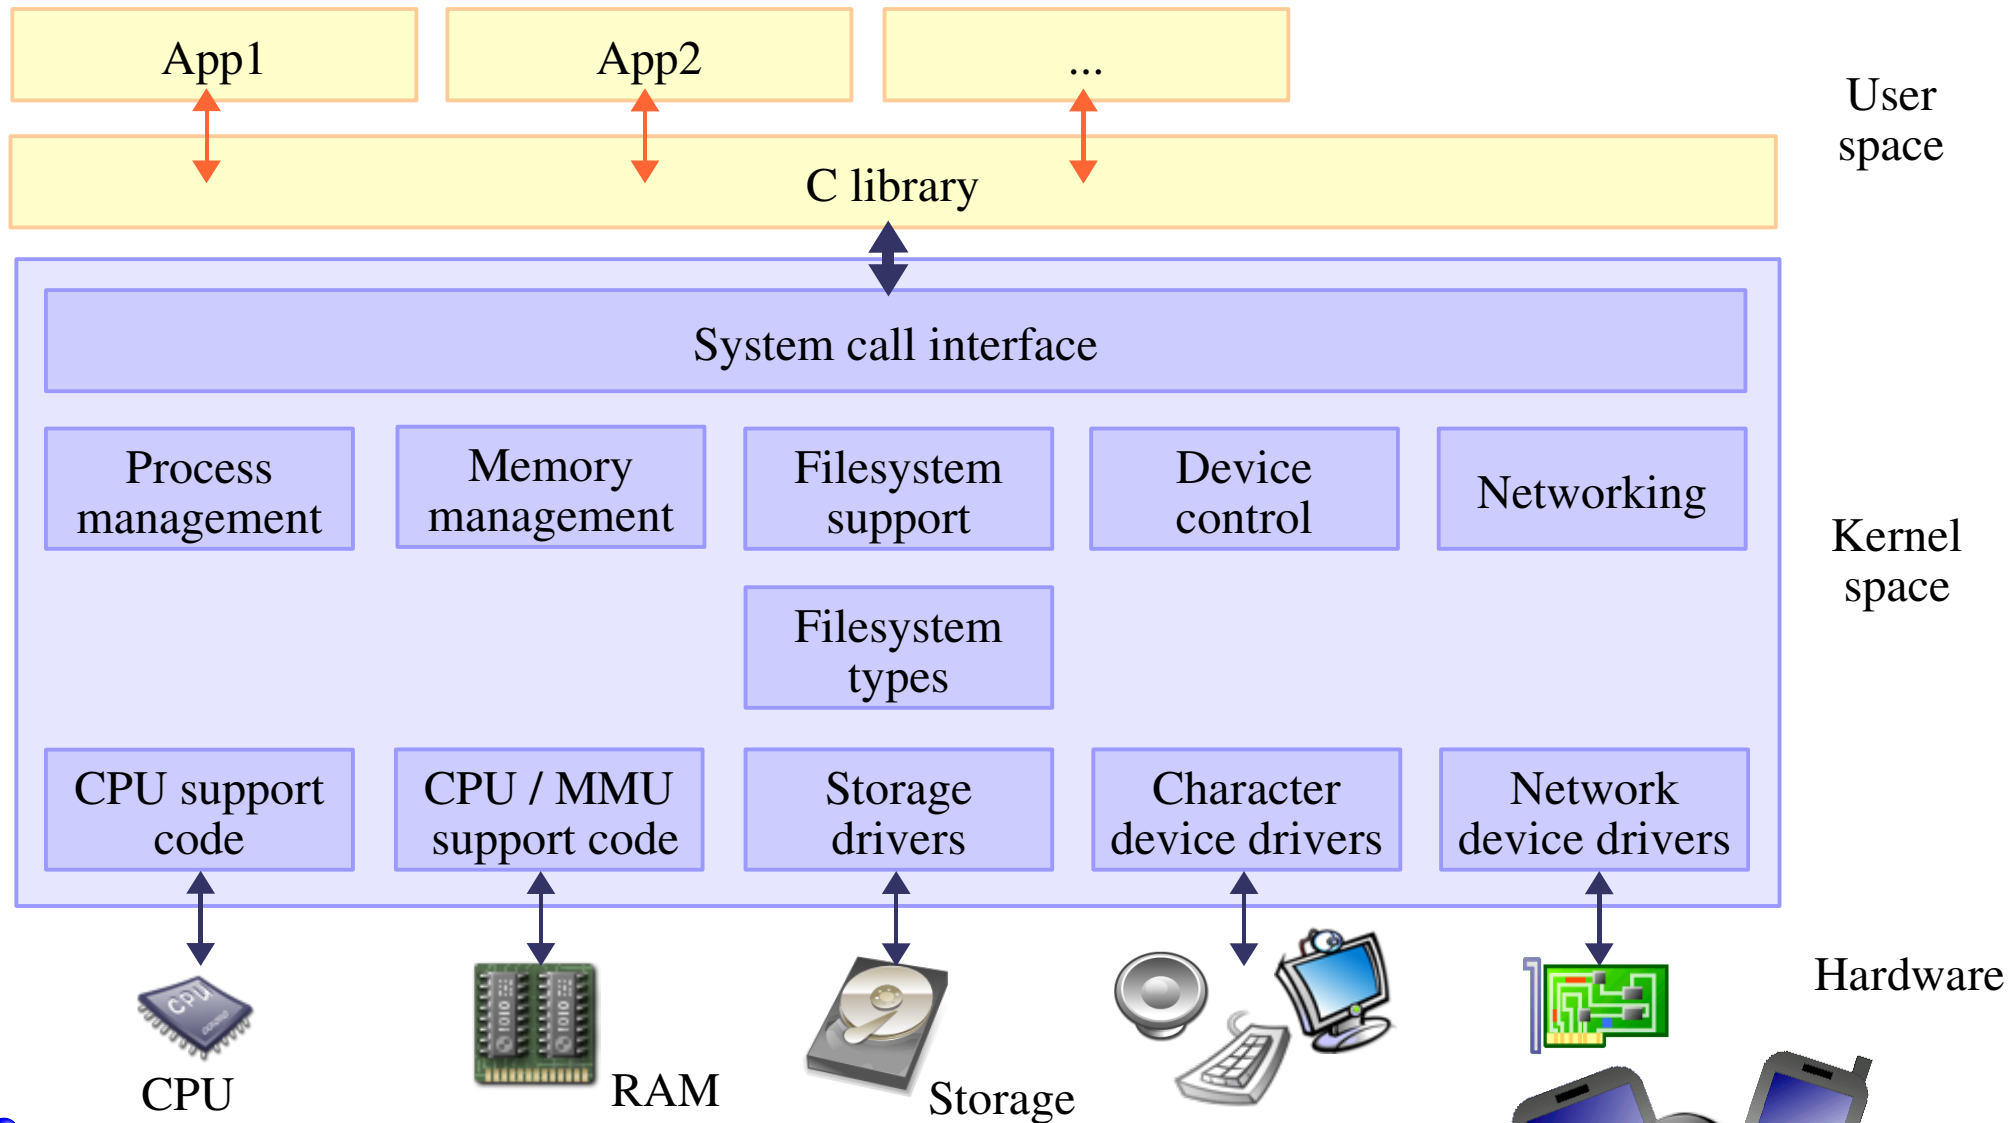

Supported hardware architectures

- ▶ See the `arch/` directory in the kernel sources
- ▶ Minimum: 32 bit processors, with or without MMU
- ▶ 32 bit architectures (`arch/` subdirectories)
`alpha`, `arm`, `cris`, `frv`, `h8300`, `i386`, `m32r`, `m68k`, `m68knommu`,
`mips`, `parisc`, `ppc`, `s390`, `sh`, `sparc`, `um`, `v850`, `xtensa`
- ▶ 64 bit architectures:
`ia64`, `mips64`, `ppc64`, `sh64`, `sparc64`, `x86_64`
- ▶ See `arch/<arch>/Kconfig`, `arch/<arch>/README`, or
`Documentation/<arch>/` for details

Kernel architecture

Embedded Linux kernel and driver development

<http://free-electrons.com>

Mar 24, 2006

Multi-tasking implementation

Linux implements preemptive multitasking

Timer frequency

Timer interrupts are raised every `HZ` th of second (= 1 *jiffy*)

▶ `HZ` is now configurable (in `Processor type and features`):
`100`, `250` (`i386` default) or `1000`.

Supported on `i386`, `ia64`, `ppc`, `ppc64`, `sparc64`, `x86_64`

See `kernel/Kconfig.hz`.

▶ Compromise between system responsiveness and global throughput.

▶ Caution: not any value can be used. Constraints apply!

Another idea is to completely turn off CPU timer interrupts when the system is idle (“dynamic tick”): see <http://muru.com/linux/dyntick>.

This saves power. Supports `arm` and `i386` so far.

I/O schedulers

- ▶ Mission of I/O schedulers: re-order reads and writes to disk to minimize disk head moves (time consuming!)

- ▶ Not needed in embedded systems with no hard disks
(data access time independent of location on flash storage)
Build your kernel with no-op I/O scheduler then!

Embedded Linux driver development

Introduction

Linux versioning scheme and development process

Linux stable releases

Major versions

- ▶ 1 major version every 2 or 3 years

Examples: 1.0, 2.0, 2.4, 2.6

Even number

Stable releases

- ▶ 1 stable release every 1 or 2 months

Examples: 2.0.40, 2.2.26, 2.4.27, 2.6.7 ...

Stable release updates (since March 2005)

- ▶ Updates to stable releases up to several times a week
Address only critical issues in the latest stable release

Examples: 2.6.11.1 to 2.6.11.7

Linux development and testing releases

Testing releases

- ▶ Several testing releases per month, before the next stable one. You can contribute to making kernel releases more stable by testing them!
Example: `2.6.12-rc1`

Development versions

- ▶ Unstable versions used by kernel developers before making a new stable major release

Examples: `2.3.42`, `2.5.74`

Odd number

Continued development in Linux 2.6

- ▶ Since 2.6.0, kernel developers have been able to introduce lots of new features one by one on a steady pace, without having to make major changes in existing subsystems.
- ▶ Opening a new Linux 2.7 (or 2.9) development branch will be required only when Linux 2.6 is no longer able to accommodate key features without undergoing traumatic changes.
- Thanks to this, more features are released to users at a faster pace.
- However, the internal kernel API can undergo changes between two 2.6.x releases. A module compiled for a given version may no longer compile or work on a more recent one.

What's new in each Linux release? (1)

```
commit 3c92c2ba33cd7d666c5f83cc32aa590e794e91b0
Author: Andi Kleen <ak@suse.de>
Date: Tue Oct 11 01:28:33 2005 +0200
```

[PATCH] i386: Don't discard upper 32bits of HWCR on K8

Need to use long long, not long when RMWing a MSR. I think it's harmless right now, but still should be better fixed if AMD adds any bits in the upper 32bit of HWCR.

Bug was introduced with the TLB flush filter fix for i386

Signed-off-by: Andi Kleen <ak@suse.de>
Signed-off-by: Linus Torvalds <torvalds@osdl.org>

...

- ▶ The official list of changes for each Linux release is just a huge list of individual patches!
- ▶ Very difficult to find out the key changes and to get the global picture out of individual changes.

What's new in each Linux release? (2)

- ▶ Fortunately, a summary of key changes with enough details is available on <http://wiki.kernelnewbies.org/LinuxChanges>
- ▶ For each new kernel release, you can also get the changes in the kernel internal API: <http://lwn.net/Articles/2.6-kernel-api/>

Embedded Linux driver development

Introduction

Legal issues

Licensing details and constraints

Linux license

- ▶ The whole Linux sources are Free Software released under the GNU General Public License (GPL)
- ▶ See our http://free-electrons.com/training/intro_unix_linux training for details about Free Software and its licenses.

Linux kernel licensing constraints

Constraints at release time (no constraint before!)

- ▶ For any device embedding Linux and Free Software, you have to release sources to the end user. You have no obligation to release them to anybody else!
- ▶ According to the GPL, only Linux drivers with a GPL compatible license are allowed.
- ▶ Proprietary modules are tolerated (but not recommended) as long as they cannot be considered as derived work of GPLed code.
- ▶ Proprietary drivers **cannot be** statically compiled in the kernel.

Advantages of free software drivers

From the driver developer / decision maker point of view

- ▶ You don't have to write your driver from scratch. You can reuse code from similar free software drivers.
- ▶ You get free community contributions, support, code review and testing. Proprietary drivers (even with sources) don't get any.
- ▶ Your drivers can be freely shipped by others (mainly by distributions)
- ▶ Your drivers can be statically compiled in the kernel
- ▶ Users and the community get a positive image of your company. Makes it easier to hire talented developers.
- ▶ You don't have to supply binary driver releases for each kernel version and patch version (closed source drivers)
- ▶ Modules have all privileges. You need the sources to make sure that a module is not a security risk.

Embedded Linux driver development

Introduction

Legal issues

Software patents

Software patents: the big legal threat

- ▶ Software implementations very well protected internationally by Copyright Law. This is automatic, no paperwork.
- ▶ However, in countries like the USA or Japan, it is now legal to patent what the software does, instead of protecting only the implementation.
- ▶ Patents can be used to prevent anyone from re-using or even improving an algorithm or an idea!
- ▶ Deadly for software competition and innovation: can't write any program without reusing any technique or idea from anyone.

See <http://wiki.ffii.org/SwpatAnim050418En> for an animated introduction

Software patents hall of shame

- ▶ The progression bar
- ▶ Amazon 1-click, Amazon gift ordering
- ▶ Electronic shopping cart
- ▶ Compressing and decompressing text files
- ▶ Compression in mobile communication
- ▶ Digital signature with extra info
- ▶ Hypermedia linking

See <http://swpat.ffii.org/patents/samples/index.en.html> for more examples

Software patent issues in the kernel

Linux Kernel driver issues because of patented algorithms

Check for software patent warnings when you configure your kernel!

- ▶ Patent warnings issued in the documentation of drivers, shown in the kernel configuration interface.
- ▶ Flash Translation Layer
`drivers/mtd/ftl.c`
In the USA, this driver can only be used on PCMCIA hardware (MSystems patent)
- ▶ Nand Flash Translation Layer
In the USA, can only be used on DiskOnChip hardware
- ▶ Networking compression
`drivers/net/bsd_comp.c`
Can't send a CCP reset-request as a result of an error detected after decompression (Motorola patent)
- ▶ Other drivers not accepted in Linux releases or algorithms not implemented because of such patents! Otherwise, more examples would be available in the source code.

How to avoid software patent issues

- ▶ Applies too when you develop in software patent free areas. You may not be able to export your products.
- ▶ Kernel drivers with patents: always check driver description in kernel configuration. Known patent issues are always documented.
- ▶ Always prefer patent free alternatives (PNG instead of GIF, Linux RTAI instead of RTLinux, etc.)
- ▶ Don't file patents on your software ideas at your turn. This may expose you more to patent risk. You will lose against software giants.

Legal support

When lawyers are after you, or to avoid legal trouble...

Free support

USA

- ▶ The Electronic Frontier Foundation
<http://eff.org/>

European Union

- ▶ The Foundation for a Free Information Infrastructure
<http://ffii.org/index.en.html>

Free Software and Open Source legal consulting, support and insurance

- ▶ Software Freedom Law Center
<http://www.softwarefreedom.org/>
- ▶ Open Source Risk Management
<http://www.osriskmanagement.com/>

Embedded Linux driver development

Introduction

Kernel user interface

Mounting virtual filesystems

- ▶ Linux makes system and kernel information available in user-space through virtual filesystems (virtual files not existing on any real storage). No need to know kernel programming to access this!

- ▶ Mounting `/proc`:

```
mount -t proc none /proc
```

- ▶ Mounting `/sys`:

```
mount -t sysfs none /sys
```

Filesystem type

Raw device
or filesystem image
In the case of virtual
filesystems, any string is fine

Mount point

Kernel userspace interface

A few examples:

- ▶ `/proc/cpuinfo`: processor information
- ▶ `/proc/meminfo`: memory status
- ▶ `/proc/version`: version and build information
- ▶ `/proc/cmdline`: kernel command line
- ▶ `/proc/<pid>/environ`: calling environment
- ▶ `/proc/<pid>/cmdline`: process command line

... and many more! See by yourself!

Userspace interface documentation

- ▶ Lots of details about the `/proc` interface are available in [Documentation/filesystems/proc.txt](#) (almost 2000 lines) in the kernel sources.
- ▶ You can also find other details in the `proc` manual page:
`man proc`
- ▶ See the [New Device Model section](#) for details about `/sys`

Embedded Linux driver development

Compiling and booting Linux Getting the sources

kernel.org

The Linux Kernel Archives

Welcome to the Linux Kernel Archives. This is the primary site for the Linux kernel source, but it has much more than just Linux kernels.

Protocol	Location
HTTP	http://www.kernel.org/pub/
FTP	ftp://ftp.kernel.org/pub/
RSYNC	rsync://rsync.kernel.org/pub/

The latest stable version of the Linux kernel is:	2.6.14	2005-10-28 00:27 UTC	F V VI C Changelog
The latest snapshot for the stable Linux kernel tree is:	2.6.14-git6	2005-11-03 17:49 UTC	V C Changelog
The latest 2.4 version of the Linux kernel is:	2.4.31	2005-06-01 00:57 UTC	F V VI C Changelog
The latest prepatch for the 2.4 Linux kernel tree is:	2.4.32-rc2	2005-10-31 21:16 UTC	V VI C Changelog
The latest 2.2 version of the Linux kernel is:	2.2.26	2004-02-25 00:28 UTC	F V Changelog
The latest prepatch for the 2.2 Linux kernel tree is:	2.2.27-rc2	2005-01-12 23:55 UTC	V VI Changelog
The latest 2.0 version of the Linux kernel is:	2.0.40	2004-02-08 07:13 UTC	F V VI Changelog
The latest -ac patch to the stable Linux kernels is:	2.6.11-ac7	2005-04-11 18:36 UTC	V
The latest -mm patch to the stable Linux kernels is:	2.6.14-rc5-mm1	2005-10-24 08:10 UTC	V Changelog

Getting Linux sources: 2 possibilities

Full sources

▶ The easiest way, but longer to download.

▶ Example:

<http://kernel.org/pub/linux/kernel/v2.6/linux-2.6.14.1.tar.bz2>

Or patch against the previous version

▶ Assuming you already have the full sources of the previous version

▶ Example:

<http://kernel.org/pub/linux/kernel/v2.6/patch-2.6.14.bz2> (2.6.13 to 2.6.14)

<http://kernel.org/pub/linux/kernel/v2.6/patch-2.6.14.7.bz2> (2.6.14 to 2.6.14.7)

Downloading full kernel sources

Downloading from the command line

- ▶ With a web browser, identify the version you need on <http://kernel.org>
- ▶ In the right directory, download the source archive and its signature (copying the download address from the browser):

```
wget http://kernel.org/pub/linux/kernel/v2.6/linux-2.6.11.12.tar.bz2
wget http://kernel.org/pub/linux/kernel/v2.6/linux-2.6.11.12.tar.bz2.sign
```

- ▶ Check the electronic signature of the archive:

```
gpg --verify linux-2.6.11.12.tar.bz2.sign
```

- ▶ Extract the contents of the source archive:

```
tar jxvf linux-2.6.11.12.tar.bz2
```

~/`.wgetrc` config file for proxies:

```
http_proxy = <proxy>:<port>
ftp_proxy = <proxy>:<port>
proxy_user = <user> (if any)
proxy_password = <passwd> (if any)
```

Downloading kernel source patches (1)

Assuming you already have the `linux-x.y.<n-1>` version

- ▶ Identify the patches you need on <http://kernel.org> with a web browser
- ▶ Download the patch files and their signature:

Patch from `2.6.10` to `2.6.11`

```
wget ftp://ftp.kernel.org/pub/linux/kernel/v2.6/patch-2.6.11.bz2  
wget ftp://ftp.kernel.org/pub/linux/kernel/v2.6/patch-2.6.11.bz2.sign
```

Patch from `2.6.11` to `2.6.11.12` (latest stable fixes)

```
wget http://www.kernel.org/pub/linux/kernel/v2.6/patch-2.6.11.12.bz2  
wget http://www.kernel.org/pub/linux/kernel/v2.6/patch-2.6.11.12.bz2.sign
```

Downloading kernel source patches (2)

- ▶ Check the signature of patch files:

```
gpg --verify patch-2.6.11.bz2.sign  
gpg --verify patch-2.6.11.12.bz2.sign
```

- ▶ Apply the patches in the right order:

```
cd linux-2.6.10/  
bzipcat ../patch-2.6.11.bz2 | patch -p1  
bzipcat ../patch-2.6.11.12.bz2 | patch -p1  
cd ..  
mv linux-2.6.10 linux-2.6.11.12
```

Checking the integrity of sources

Kernel source integrity can be checked through OpenPGP digital signatures.
Full details on <http://www.kernel.org/signature.html>

- ▶ If needed, read <http://www.gnupg.org/gph/en/manual.html> and create a new private and public keypair for yourself.
- ▶ Import the public GnuPG key of kernel developers:
 - ▶ `gpg --keyserver pgp.mit.edu --recv-keys 0x517D0F0E`
 - ▶ If blocked by your firewall, look for `0x517D0F0E` on <http://pgp.mit.edu/>, copy and paste the key to a `linuxkey.txt` file:
`gpg --import linuxkey.txt`
- ▶ Check the signature of files:
`gpg --verify linux-2.6.11.12.tar.bz2.sign`

Anatomy of a patch file

A patch file is the output of the `diff` command

```
diff -Nru a/Makefile b/Makefile
--- a/Makefile 2005-03-04 09:27:15 -08:00
+++ b/Makefile 2005-03-04 09:27:15 -08:00
@@ -1,7 +1,7 @@
VERSION = 2
PATCHLEVEL = 6
SUBLEVEL = 11
-EXTRAVERSION =
+EXTRAVERSION = .1
NAME=Woozy Numbat

# *DOCUMENTATION*
```

← diff command line

← File date info

← Line numbers in files

← Context info: 3 lines before the change
Useful to apply a patch when line numbers changed

← Removed line(s) if any

← Added line(s) if any

← Context info: 3 lines after the change

Using the patch command

The `patch` command applies changes to files in the current directory:

- ▶ Making changes to existing files
- ▶ Creating or deleting files and directories

`patch` usage examples:

- ▶ `patch -p<n> < diff_file`
- ▶ `cat diff_file | patch -p<n>`
- ▶ `bzcat diff_file.bz2 | patch -p<n>`
- ▶ `zcat diff_file.gz | patch -p<n>`

`n`: number of directory levels to skip in the file paths

Applying a Linux patch

Linux patches...

- ▶ Always to apply to the `x.y.<z-1>` version
- ▶ Always produced for `n=1` (that's what everybody does... do it too!)
- ▶ Downloadable in `gzip` and `bzip2` (much smaller) compressed files.
- ▶ Linux patch command line example:

```
cd linux-2.6.10  
bzip2 -d ../patch-2.6.11.bz2 | patch -p1  
cd ..; mv linux-2.6.10 linux-2.6.11
```
- ▶ Keep patch files compressed: useful to check their signature later.
You can still view (or even edit) the uncompressed data with `vi`:

```
vi patch-2.6.11.bz2
```

 (on the fly (un)compression)

Accessing development sources (1)

- ▶ Kernel development sources are now managed with `git`
- ▶ You can browse Linus' `git` tree (if you just need to check a few files):
<http://www.kernel.org/git/?p=linux/kernel/git/torvalds/linux-2.6.git;a=tree>
- ▶ Get and compile `git` from <http://kernel.org/pub/software/scm/git/>
- ▶ Get and compile the `cogito` front-end from
<http://kernel.org/pub/software/scm/cogito/>
- ▶ If you are behind a proxy, set Unix environment variables defining proxy settings. Example:

```
export http_proxy="proxy.server.com:8080"  
export ftp_proxy="proxy.server.com:8080"
```

Accessing development sources (2)

- ▶ Pick up a git development tree on <http://kernel.org/git/>
- ▶ Get a local copy (“clone”) of this tree.

Example (Linus tree, the one used for **Linux** stable releases):

```
cg-clone http://kernel.org/pub/scm/linux/kernel/git/torvalds/linux-2.6.git  
or cg-clone rsync://rsync.kernel.org/pub/scm/linux/kernel/git/torvalds/linux-2.6.git
```

- ▶ Update your copy whenever needed (Linus tree example):
`cd linux-2.6`
`cg-update origin`

More details available

on <http://git.or.cz/> or <http://linux.yyz.us/git-howto.html>

Embedded Linux driver development

Compiling and booting Linux Structure of source files

Linux sources structure (1)

<code>arch/</code>	Architecture dependent code
<code>COPYING</code>	Linux copying conditions (GNU GPL)
<code>CREDITS</code>	Linux main contributors
<code>crypto/</code>	Cryptographic libraries
<code>Documentation/</code>	Kernel documentation. Don't miss it!
<code>drivers/</code>	All device drivers (<code>drivers/usb/</code> , etc.)
<code>fs/</code>	Filesystems (<code>fs/ext3/</code> , etc.)
<code>include/</code>	Kernel headers
<code>include/asm-<arch></code>	Architecture dependent headers
<code>include/linux</code>	Linux kernel core headers
<code>init/</code>	Linux initialization (including <code>main.c</code>)
<code>ipc/</code>	Code used for process communication

Linux sources structure (2)

<code>kernel/</code>	Linux kernel core (very small!)
<code>lib/</code>	Misc library routines (<code>zlib</code> , <code>crc32...</code>)
<code>MAINTAINERS</code>	Maintainers of each kernel part. Very useful!
<code>Makefile</code>	Top Linux makefile (sets arch and version)
<code>mm/</code>	Memory management code (small too!)
<code>net/</code>	Network support code (not drivers)
<code>README</code>	Overview and building instructions
<code>REPORTING-BUGS</code>	Bug report instructions
<code>scripts/</code>	Scripts for internal or external use
<code>security/</code>	Security model implementations (<code>SELinux...</code>)
<code>sound/</code>	Sound support code and drivers
<code>usr/</code>	Early user-space code (<code>initramfs</code>)

On-line kernel documentation

<http://free-electrons.com/kerneldoc/>

- ▶ Provided for all recent kernel releases
- ▶ Easier than downloading kernel sources to access documentation
- ▶ Indexed by Internet search engines
Makes kernel pieces of documentation easier to find!
- ▶ Unlike most other sites offering this service too, also includes an HTML translation of kernel documents in the DocBook format.

Never forget documentation in the kernel sources! It's a very valuable way of getting information about the kernel.

Embedded Linux driver development

Compiling and booting Linux Kernel source management tools

LXR: Linux Cross Reference

<http://lxr.linux.no/>

Generic source indexing tool and code browser

- ▶ Web server based
Very easy and fast to use
- ▶ Identifier or text search available
- ▶ Very easy to find the declaration, implementation or usages of symbols
- ▶ Supports C and C++
- ▶ Supports huge code projects such as the Linux kernel (230 M)

- Takes a little bit of time and patience to setup (configuration, indexing, server configuration).
- Initial indexing quite slow:
Linux 2.6.11: 1h 40min on P4 M
1.6 GHz, 2 MB cache
- LXR servers on the Internet:
don't need to set up LXR by yourself.
Make your searches with one of these:
<http://sosdg.org/~coywolf/lxr/source/>
<http://lxr.linux.no/source/> (a bit outdated)

LXR screenshot

The screenshot shows a Mozilla Firefox browser window displaying the LXR (Linux Cross-Referencing) interface. The address bar shows the URL `http://lxr.linux.no/source/kernel/user.c`. The page title is "Cross-Referencing Linux" and the specific file being viewed is "Linux/kernel/user.c".

Navigation links on the right include: [source navigation], [diff markup], [identifier search], [freetext search], and [file search].

Version and Architecture selection links are provided:

Version: [1.0.9] [1.2.13] [2.0.40] [2.2.26] [2.4.18] [2.4.20] [2.4.28] [2.6.10] [2.6.11]

Architecture: [i386] [alpha] [arm] [ia64] [m68k] [mips] [mips64] [ppc] [s390] [sh] [sparc] [sparc64] [x86_64]

The main content area displays the source code for `kernel/user.c`, starting with a comment block:

```
1 /*
2  * The "user cache".
3  *
4  * (C) Copyright 1991-2000 Linus Torvalds
5  *
6  * We have a per-user structure to keep track of how many
7  * processes, files etc the user has claimed, in order to be
8  * able to have per-user limits for system resources.
9  */
10

31 struct user_struct root_user = {
32     .__count      = ATOMIC_INIT(1),
33     .processes    = ATOMIC_INIT(1),
34 }
```

Ketchup - Easy access to kernel source trees

<http://www.selenic.com/ketchup/wiki/>

- ▶ Makes it easy to get the latest version of a given kernel source tree (2.6, 2.6-rc, 2.6-git, 2.6-mm, 2.6-rt...)
- ▶ Only downloads the needed patches.
Reverts patches when needed to apply a more recent patch.
- ▶ Also checks the signature of sources and patches.
- ▶ Caution: if 0.9.6 is still the latest version, you will need patches from <http://free-electrons.com/pub/patches/ketchup/>

Ketchup examples

- ▶ Get the version in the current directory:

```
> ketchup -m  
2.6.10
```

- ▶ Upgrade to the latest stable version:

```
> ketchup 2.6-tip  
2.6.10 -> 2.6.12.5  
Applying patch-2.6.11.bz2  
Applying patch-2.6.12.bz2  
Applying patch-2.6.12.5.bz2
```

More on <http://selenic.com/ketchup/wiki/index.cgi/ExampleUsage>

Practical lab – Kernel sources

Time to start **Lab 1!**

- ▶ Get the sources
- ▶ Check the authenticity of sources
- ▶ Apply patches
- ▶ Get familiar with the sources
- ▶ Use a kernel source indexing tool

Embedded Linux driver development

Compiling and booting Linux Kernel configuration

Kernel configuration overview

- ▶ **Makefile** edition

Setting the version and target architecture if needed

- ▶ Kernel configuration: defining what features to include in the kernel:

```
make [config|xconfig|gconfig|menuconfig|oldconfig]
```

- ▶ Kernel configuration file (Makefile syntax) stored in the `.config` file at the root of the kernel sources

- ▶ Distribution kernel config files usually released in `/boot/`

Makefile changes

- ▶ To identify your kernel image with others build from the same sources, use the **EXTRAVERSION** variable:

```
VERSION = 2
```

```
PATCHLEVEL = 6
```

```
SUBLEVEL = 15
```

```
EXTRAVERSION = -acme1
```

- ▶ `uname -r` will return:
`2.6.15-acme1`

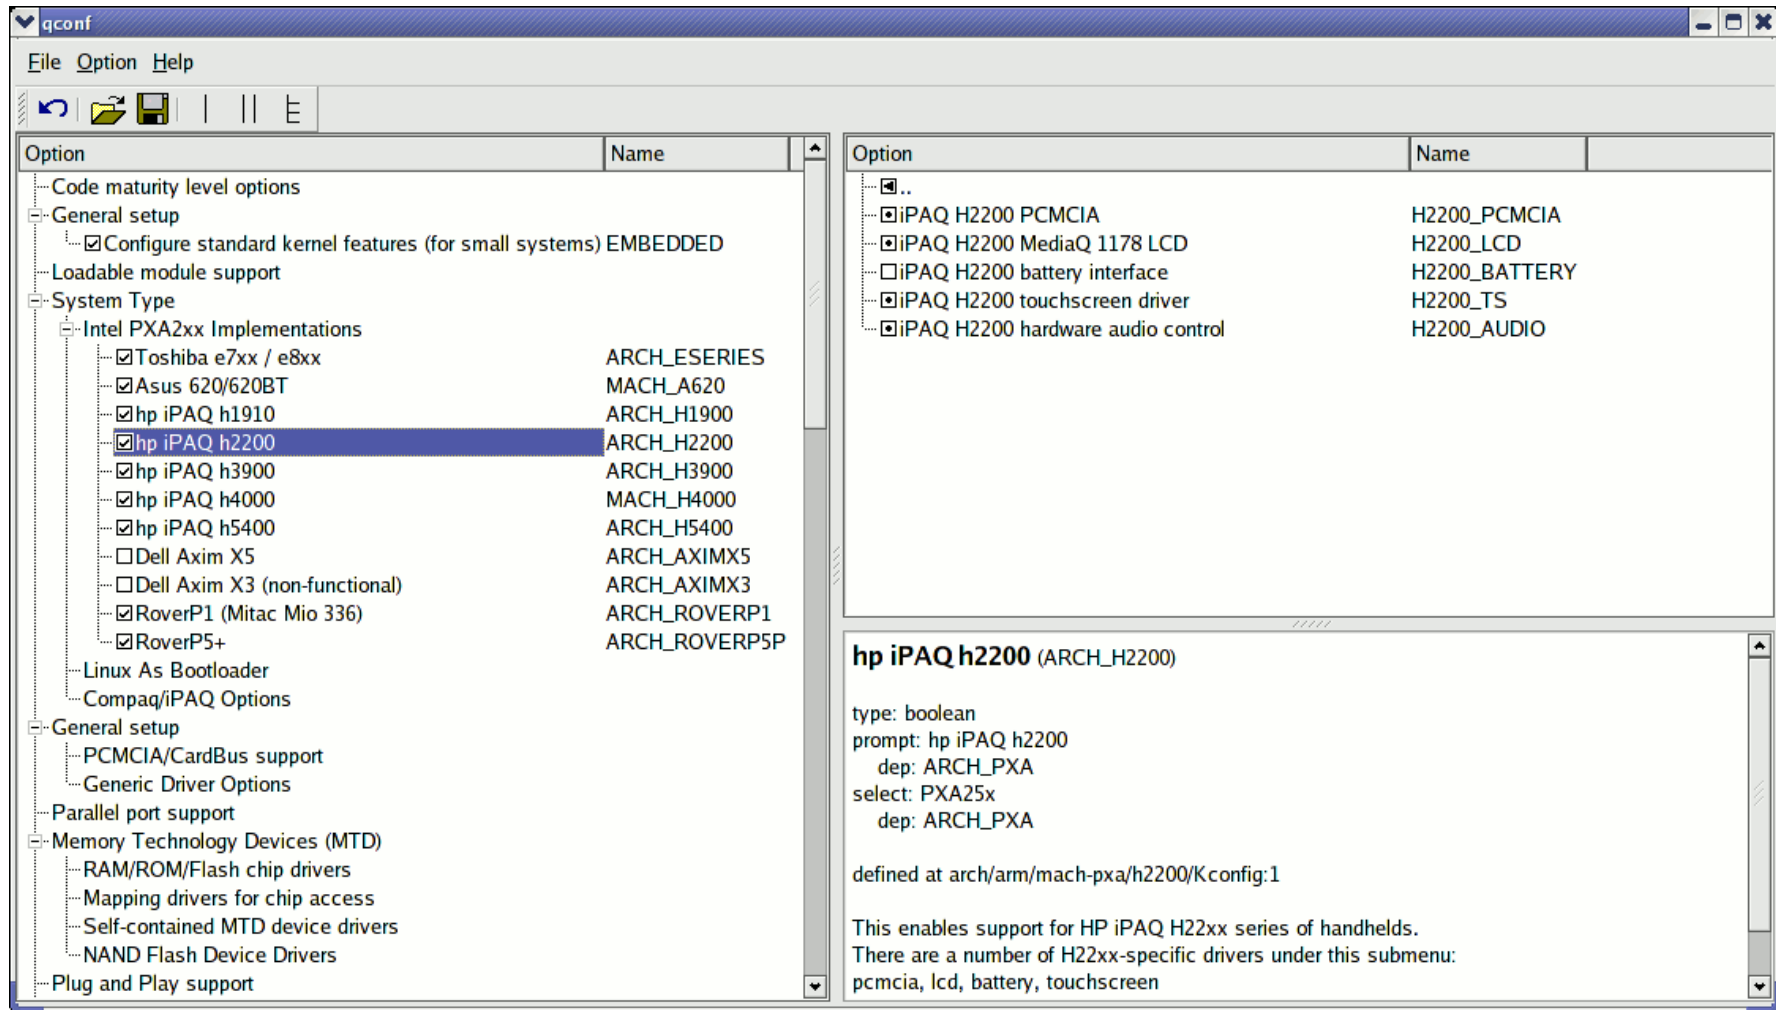

make xconfig

make xconfig

- ▶ New Qt configuration interface for Linux 2.6.
Much easier to use!
- ▶ Make sure you read
`help -> introduction: useful options!`
- ▶ File browser: easier to load configuration files

make xconfig screenshot

Compiling statically or as a module

Compiled as a separate module
`CONFIG_ISO9660_FS=m`

Driver options

`CONFIG_JOLIET=y`

`CONFIG_ZISOFS=y`

- ISO 9660 CDROM file system support
- Microsoft Joliet CDROM extensions
- Transparent decompression extension
- UDF file system support

Compiled statically in the kernel
`CONFIG_UDF_FS=y`

Loadable kernel modules (1)

- ▶ Modules: add a given functionality to the kernel (drivers, filesystem support, and many others)
- ▶ Can be loaded and unloaded at any time, only when their functionality is needed. Once loaded, have full access to the whole kernel. No particular protection.
- ▶ Useful to keep the kernel image size to the minimum (essential in GNU/Linux distributions for PCs).

Loadable kernel modules (2)

- ▶ Useful to support incompatible drivers (either load one or the other, but not both)
- ▶ Useful to deliver binary-only drivers (bad idea) without having to rebuild the kernel.
- ▶ Modules make it easy to develop drivers without rebooting: load, test, unload, rebuild, load...
- ▶ Modules can also be compiled statically into the kernel.

make config / menuconfig / gconfig

make config

- ▶ Asks you the questions 1 by 1. Extremely long!

make menuconfig

- ▶ Same old text interface as in Linux 2.4.
Useful when no graphics are available.
Pretty convenient too!

make gconfig

- ▶ New **GTK** based graphical configuration interface.
Functionality similar to that of **make xconfig**.

make oldconfig

make oldconfig

- ▶ Needed very often!
- ▶ Useful to upgrade a `.config` file from an earlier kernel release
- ▶ Issues warnings for obsolete symbols
- ▶ Asks for values for new symbols

If you edit a `.config` file by hand, it's strongly recommended to run `make oldconfig` afterwards!

make allnoconfig

`make allnoconfig`

- ▶ Only sets strongly recommended settings to **y**.
- ▶ Sets all other settings to **n**.
- ▶ Very useful in embedded systems to select only the minimum required set of features and drivers.
- ▶ Much more convenient than unselecting hundreds of features one by one!

make help

make help

- ▶ Lists all available `make` targets
- ▶ Useful to get a reminder, or to look for new or advanced options!

Embedded Linux driver development

Compiling and booting Linux Compiling the kernel

Compiling and installing the kernel

Compiling step

▶ `make`

Install steps (logged as `root!`)

▶ `make install`

▶ `make modules_install`

Dependency management

- ▶ When you modify a regular kernel source file, `make` only rebuilds what needs recompiling. That's what it is used for.
- ▶ However, the `Makefile` is quite pessimistic about dependencies. When you make significant changes to the `.config` file, `make` often redoes much of the compile job!

Compiling faster on multiprocessor hosts

- ▶ If you are using a workstation with n processors, you may roughly divide your compile time by n by compiling several files in parallel
- ▶ `make -j <n>`
Runs several targets in parallel, whenever possible
- ▶ Using `make -j 2` or `make -j 3` on single processor workstations. This doesn't help much. In theory, several parallel compile jobs keep the processor busy while other processes are waiting for files to be read or written. In practice, you don't get any significant speedup (not more than 10%), unless your I/Os are very slow.

Compiling faster with ccache

<http://ccache.samba.org/>

Compiler cache for C and C++, already shipped by some distributions
Much faster when compiling the same file a second time!

▶ Very useful when `.config` file change are frequent.

▶ Use it by adding a `ccache` prefix

to the `CC` and `HOSTCC` definitions in `Makefile`:

```
CC          = ccache $(CROSS_COMPILE)gcc
HOSTCC      = ccache gcc
```

▶ Performance benchmarks:

-63%: with a Fedora Core 3 config file (many modules!)

-82%: with an embedded Linux config file (much fewer modules!)

Kernel compiling tips

- ▶ View the full (`gcc`, `ld...`) command line:
`make V=1`

- ▶ Clean-up generated files
(to force re-compiling drivers):
`make clean`

- ▶ Remove **all** generated files
(mainly to create patches)

Caution: also removes your `.config` file!
`make mrproper`

Generated files

Created when you run the `make` command

- ▶ `vmlinux`
Raw Linux kernel image, non compressed.
- ▶ `arch/<arch>/boot/zImage` (default image on `arm`)
`zlib` compressed kernel image
- ▶ `arch/<arch>/boot/bzImage` (default image on `i386`)
Also a `zlib` compressed kernel image.
Caution: `bz` means “big zipped” but not “`bzip2` compressed”!
(`bzip2` compression support only available on `i386` as a tactical patch.
Not very attractive for small embedded systems though: consumes 1 MB of RAM for decompression).

Files created by make install

- ▶ `/boot/vmlinuz-<version>`
Compressed kernel image. Same as the one in `arch/<arch>/boot`
- ▶ `/boot/System.map-<version>`
Stores kernel symbol addresses
- ▶ `/boot/initrd-<version>.img`
Initial RAM disk, storing the modules you need to mount your root filesystem. `make install` runs `mkinitrd` for you!
- ▶ `/etc/grub.conf` or `/etc/lilo.conf`
`make install` updates your bootloader configuration files to support your new kernel! It reruns `/sbin/lilo` if **LILO** is your bootloader.

Files created by `make modules_install` (1)

`/lib/modules/<version>/`: Kernel modules + extras

▶ `build/`

Everything needed to build more modules for this kernel: `Makefile`, `.config` file, module symbol information (`module.symvers`), kernel headers (`include/` and `include/asm/`)

▶ `kernel/`

Module `.ko` (Kernel Object) files, in the same directory structure as in the sources.

Files created by make modules_install (2)

/lib/modules/<version>/ (continued)

▶ modules.alias

Module aliases for module loading utilities. Example line:

```
alias sound-service-?-0 snd_mixer_oss
```

▶ modules.dep

Module dependencies (see next page)

▶ modules.symbols

Tells which module a given symbol belongs to.

All the files in this directory are text files.

Don't hesitate to have a look by yourself!

Module dependencies

- ▶ Module dependencies stored in `/lib/modules/<version>/modules.dep`
- ▶ They don't have to be described by the module writer.
- ▶ They are automatically computed during kernel building from module exported symbols. `module2` depends on `module1` if `module2` uses a symbol exported by `module1`.
- ▶ You can update the `modules.dep` file by running (as `root`)
`depmod -a [<version>]`

Compiling the kernel in a nutshell

- ▶ Edit version information in the `Makefile` file
- ▶ `make xconfig`
`make`
`make install`
`make modules_install`

Embedded Linux driver development

Compiling and booting Linux Booting and system startup

Booting sequence

Bootloader

- Executed by the hardware at a fixed location in ROM / Flash
- Initializes support for the device where the kernel image is found (local storage, network, removable media)
- Loads the kernel image in RAM
- Executes the kernel image (with a specified command line)

Kernel

- Uncompresses itself
- Initializes statically compiled drivers (needed to access the root filesystem)
- Mounts the root filesystem (needed to access and run userspace programs)
- Executes the first userspace program

First userspace program

- Configures userspace and starts up system services

Typical booting sequence with initrd

Bootloader

- Executed by the hardware at a fixed location in ROM / Flash
- Initializes support for the device where the images are found (local storage, network, removable media)
- Loads the kernel and init ramdisk (initrd) images in RAM
- Executes the kernel image (with a specified command line)

Kernel

- Uncompresses itself
- Initializes statically compiled drivers (needed to access the initrd filesystem)
- Mounts the initrd as the first root filesystem
- Executes the first userspace program: usually `/linuxrc`

Userspace: `/linuxrc` script in initrd

- Runs userspace commands to configure the device (such as network setup, mounting `/proc` and `/sys...`)
- Loads kernel modules (drivers) stored in the initrd, needed to access the new root filesystem.
- Mounts the new root filesystem. Switch to it (`pivot_root`)
- Runs `/sbin/init` (or sometimes a new `/linuxrc` script)

Userspace: `/sbin/init`

- Runs commands to configure the device (if not done yet in the initrd)
- Starts up system services (daemons, servers) and user programs

2-stage bootloaders

- ▶ At startup, the hardware automatically executes the bootloader from a given location, usually with very little space (such as the boot sector on a PC hard disk)
- ▶ Because of this lack of space, 2 stages are implemented:
 - ▶ 1st stage: minimum functionality. Just accesses the second stage on a bigger location and executes it.
 - ▶ 2nd stage: offers the full bootloader functionality. No limit in what can be implemented. Can even be an operating system itself!

x86 bootloaders

- ▶ LILO: LInux LOad. Original Linux bootloader. Still in use!
<http://freshmeat.net/projects/lilo/>
Supports: x86
- ▶ GRUB: GRand Unified Bootloader from GNU. More powerful.
<http://www.gnu.org/software/grub/>
Supports: x86
- ▶ SYSLINUX: Utilities for network and removable media booting
<http://syslinux.zytor.com>
Supports: x86

Generic bootloaders

- ▶ **Das U-Boot:** Universal Bootloader from Denk Software

The most used on **arm**.

<http://u-boot.sourceforge.net/>

Supports: **arm, ppc, mips, x86**

- ▶ **RedBoot:** eCos based bootloader from Red-Hat

<http://sources.redhat.com/redboot/>

Supports: **x86, arm, ppc, mips, sh, m68k...**

- ▶ **uMon:** MicroMonitor general purpose, multi-OS bootloader

<http://microcross.com/html/micromonitor.html>

Supports: **ARM, ColdFire, SH2, 68K, MIPS, PowerPC, Xscale...**

Specific bootloaders

- ▶ sh-boot: LinuxSH project bootloader

<http://cvs.sourceforge.net/viewcvs.py/linuxsh/sh-boot/>

Supports: **sh**

- ▶ LAB: Linux As Bootloader, from Handhelds.org
Part of Handhelds.org's Linux kernel.

See <http://handhelds.org/cgi-bin/cvsweb.cgi/linux/kernel26/lab/>

Supports: **arm** (experimental)

- ▶ And many more: lots of platforms have their own.

Kernel command line parameters

As most C programs, the Linux kernel accepts command line arguments

- ▶ Kernel command line arguments are part of the bootloader configuration settings.
- ▶ Useful to configure the kernel at boot time, without having to recompile it.
- ▶ Useful to perform advanced kernel and driver initialization, without having to use complex user-space scripts.

Kernel command line example

HP iPAQ h2200 PDA booting example:

`root=/dev/ram0 \`

`rw \`

`init=/linuxrc \`

`console=ttyS0,115200n8 \`

`console=tty0 \`

`ramdisk_size=8192 \`

`cache_policy=writethrough`

Root filesystem (first ramdisk)

Root filesystem mounting mode

First userspace program

Console (serial)

Other console (framebuffer)

Misc parameters...

Hundreds of command line parameters described on
[Documentation/kernel-parameters.txt](#)

How to create an initrd

```
mkdir /mnt/initrd
dd if=/dev/zero of=initrd.img bs=1k count=2048
mkfs.ext2 -F initrd.img
mount -o loop initrd.img /mnt/initrd
```

Fill the ramdisk contents: busybox, modules, `/linuxrc` script

More details in the [Free Software tools for embedded systems training!](#)

```
umount /mnt/initrd
gzip --best -c initrd.img > initrd
```

More details on [Documentation/initrd.txt](#) in the kernel sources! Also explains pivot rooting.

Booting variants

XIP (Execute In Place)

- ▶ The kernel image is directly executed from the storage
 - ▶ Can be faster and save RAM
- However, the kernel image can't be compressed

No initrd

- ▶ Directly mounting the final root filesystem instead of the initrd
(`root` kernel command line option)

No new root filesystem

- ▶ Running the whole system from the initrd

Usefulness of rootfs on NFS

Once networking works, your root filesystem could be a directory on your GNU/Linux development host, exported by NFS (Network File System). This is very convenient for system development:

- ▶ Makes it very easy to update files (driver modules in particular) on the root filesystem, without rebooting. Much faster than through the serial port.
- ▶ Can have a big root filesystem even if you don't have support for internal or external storage yet.
- ▶ The root filesystem can be huge. You can even build native compiler tools and build all the tools you need on the target itself (better to cross-compile though).

NFS boot setup (1)

On the PC (NFS server)

- ▶ Add the below line to your `/etc/exports` file:
`/home/rootfs 192.168.0.202/32(rw,insecure,sync,no_wdelay,no_root_squash)`
client address NFS server options
- ▶ If not running yet, you may need to start `portmap`
(Fedora Core example):
`/etc/init.d/portmap start`
- ▶ Start or restart your NFS server (Fedora Core 4 example)
`/etc/init.d/nfs restart`

NFS boot setup (2)

On the target (NFS client)

▶ Compile your kernel with `CONFIG_NFS_FS=y`
and `CONFIG_ROOT_NFS=y`

▶ Boot the kernel with the below command line options:

`root=/dev/nfs`

virtual device

`ip=192.168.1.111:192.168.1.110:192.168.1.100:255.255.255.0:at91:eth0`

local IP address

server IP address

gateway

netmask

hostname device

`nfsroot=192.168.1.110:/home/nfsroot`

NFS server IP address Directory on the NFS server

First user-space program

- ▶ Specified by the `init` kernel command line parameter
- ▶ Executed at the end of booting by the kernel
- ▶ Takes care of starting all other user-space programs (system services and user programs).
- ▶ Gets the `1` process number (pid)
Parent or ancestor of all user-space programs
The system won't let you kill it.
- ▶ Only other user-space program called by the kernel:
`/sbin/hotplug`

/linuxrc

- ▶ 1 of the 2 default init programs
(if no `init` parameter is given to the kernel)
- ▶ Traditionally used in initrds or in simple systems not using `/sbin/init`.
- ▶ Is most of the time a shell script, based on a very lightweight shell: `nash` or `busybox sh`
- ▶ This script can implement complex tasks: detecting drivers to load, setting up networking, mounting partitions, switching to a new root filesystem...

The init program

- ▶ `/sbin/init` is the second default init program
- ▶ Takes care of starting system services, and eventually the user interfaces (`sshd`, `X server`...)
- ▶ Also takes care of stopping system services
- ▶ Lightweight, partial implementation available through `busybox`

See the [Init runlevels](#) annex section for more details about starting and stopping system services with `init`.

However, simple startup scripts are often sufficient in embedded systems.

Embedded Linux driver development

Compiling and booting Linux Linux device files

Character device files

- ▶ Accessed through a sequential flow of individual characters
- ▶ Character devices can be identified by their **c** type (`ls -l`):

```
crw-rw---- 1 root uucp    4,   64 Feb 23 2004 /dev/ttyS0
crw--w---- 1 jdoe tty    136,   1 Feb 23 2004 /dev/pts/1
crw----- 1 root root    13,   32 Feb 23 2004 /dev/input/mouse0
crw-rw-rw- 1 root root     1,    3 Feb 23 2004 /dev/null
```

- ▶ Example devices: keyboards, mice, parallel port, IrDA, Bluetooth port, consoles, terminals, sound, video...

Block device files

- ▶ Accessed through data blocks of a given size. Blocks can be accessed in any order.
- ▶ Block devices can be identified by their **b** type (`ls -l`):

```
brw-rw---- 1 root disk      3,  1 Feb 23  2004 hda1
brw-rw---- 1 jdoe floppy    2,  0 Feb 23  2004 fd0
brw-rw---- 1 root disk      7,  0 Feb 23  2004 loop0
brw-rw---- 1 root disk      1,  1 Feb 23  2004 ram1
brw----- 1 root root      8,  1 Feb 23  2004 sda1
```

- ▶ Example devices: hard or floppy disks, ram disks, loop devices...

Device major and minor numbers

As you could see in the previous examples, device files have 2 numbers associated to them:

- ▶ First number: *major* number
- ▶ Second number: *minor* number
- ▶ Major and minor numbers are used by the kernel to bind a driver to the device file. Device file names don't matter to the kernel!
- ▶ To find out which driver a device file corresponds to, or when the device name is too cryptic, see [Documentation/devices.txt](#).

Device file creation

▶ Device files are not created when a driver is loaded.

▶ They have to be created in advance:

```
mknod /dev/<device> [c|b] <major> <minor>
```

▶ Examples:

```
mknod /dev/ttyS0 c 4 64
```

```
mknod /dev/hda1 b 3 1
```

Drivers without device files

They don't have any corresponding `/dev` entry you could read or write through a regular Unix command.

▶ Network drivers

They are represented by a network device such as `ppp0`, `eth1`, `usbnet`, `irda0` (listed by `ifconfig -a`)

▶ Other drivers

Often intermediate or lowlevel drivers just interfacing with other ones. Example: `usbcore`.

Practical lab – Configuring and compiling

Time to start **Lab 2!**

- ▶ Configure your kernel
- ▶ Compile it
- ▶ Boot it on a virtual PC
- ▶ Modify a root filesystem image by adding entries to the `/dev/` directory

Embedded Linux driver development

Compiling and booting Linux Cross-compiling the kernel

Makefile changes

- ▶ Update the version as usual
- ▶ You should change the default target platform.

Example: ARM platform, cross-compiler command: `arm-linux-gcc`

```
ARCH    ?= arm
```

```
CROSS_COMPILE    ?= arm-linux-
```

(The Makefile defines later `CC = $(CROSS_COMPILE)gcc`)

See comments in `Makefile` for details

Configuring the kernel

```
make xconfig
```

- ▶ Same as in native compiling.
- ▶ Don't forget to set the right board / machine type!

Ready-made config files

```
assabet_defconfig      integrator_defconfig  mainstone_defconfig
badge4_defconfig       iq31244_defconfig    mxlads_defconfig
bast_defconfig         iq80321_defconfig    neponset_defconfig
cerfcube_defconfig    iq80331_defconfig    netwinder_defconfig
clps7500_defconfig    iq80332_defconfig    omap_h2_1610_defconfig
ebsa110_defconfig     ixdp2400_defconfig   omnimeter_defconfig
edb7211_defconfig     ixdp2401_defconfig   pleb_defconfig
enp2611_defconfig     ixdp2800_defconfig   pxa255-idp_defconfig
ep80219_defconfig     ixdp2801_defconfig   rpc_defconfig
epxa10db_defconfig    ixp4xx_defconfig     s3c2410_defconfig
footbridge_defconfig  jornada720_defconfig shannon_defconfig
fortunet_defconfig    lart_defconfig        shark_defconfig
h3600_defconfig       lpd7a400_defconfig   simpad_defconfig
h7201_defconfig       lpd7a404_defconfig   smdk2410_defconfig
h7202_defconfig       lubbock_defconfig    versatile_defconfig
hackkit_defconfig     lus17200_defconfig
```

arch/arm/configs example

Using ready-made config files

- ▶ Default configuration files available for many boards / machines!
Check if one exists in `arch/<arch>/configs/` for your target.
- ▶ Example: if you found an `acme_defconfig` file, you can run:
`make acme_defconfig`
- ▶ Using `arch/<arch>/configs/` is a very good good way of releasing a default configuration file for a group of users or developers.

Cross-compiling setup

Example

- ▶ If you have an ARM cross-compiling toolchain in `/usr/local/arm/3.3.2/`
- ▶ You just have to add it to your Unix search path:
`export PATH=/usr/local/arm/3.3.2/bin:$PATH`

Choosing a toolchain

- ▶ See the [Documentation/Changes](#) file in the sources for details about minimum tool versions requirements.
- ▶ More about toolchains: Free Software tools for embedded systems training: <http://free-electrons.com/training/devtools/>

Building the kernel

- ▶ Run `make`
- ▶ Copy `arch/<platform>/boot/zImage` to the target storage
- ▶ You can customize `arch/<arch>/boot/install.sh` so that `make install` does this automatically for you.
- ▶ `make INSTALL_MOD_PATH=<dir>/ modules_install` and copy `<dir>/` to `/lib/modules/` on the target storage

Cross-compiling summary

- ▶ Edit `Makefile`: set `ARCH`, `CROSS_COMPILE` and `EXTRA_VERSION`
- ▶ Get the default configuration for your machine:
`make <machine>_defconfig` (if existing in `arch/<arch>/configs`)
- ▶ Refine the configuration settings according to your requirements:
`make xconfig`
- ▶ Add the crosscompiler path to your `PATH` environment variable
- ▶ Compile the kernel: `make`
- ▶ Copy the kernel image from `arch/<arch>/boot/` to the target
- ▶ Copy modules to a directory which you replicate on the target:
`make INSTALL_MOD_PATH=<dir> modules_install`

Practical lab – Cross-compiling

Time to start **Lab 3!**

- ▶ Set up a cross-compiling environment
- ▶ Configure the kernel **Makefile** accordingly
- ▶ Cross-compile the kernel for an **arm** target platform

Embedded Linux driver development

Driver development A simple module

hello module

```
/* hello.c */
#include <linux/init.h>
#include <linux/module.h>
#include <linux/kernel.h>

static int __init hello_init(void)
{
    printk(KERN_ALERT "Good morrow");
    printk(KERN_ALERT "to this fair assembly.\n");
    return 0;
}

static void __exit hello_exit(void)
{
    printk(KERN_ALERT "Alas, poor world, what treasure");
    printk(KERN_ALERT "hast thou lost!\n");
}

module_init(hello_init);
module_exit(hello_exit);
MODULE_LICENSE("GPL");
MODULE_DESCRIPTION("Greeting module");
MODULE_AUTHOR("William Shakespeare");
```

`__init`: removed after initialization

`__exit`: discarded when module compiled statically into the kernel

Example available on <http://free-electrons.com/doc/c/hello.c>

Module license usefulness

- ▶ Used by kernel developers to identify issues coming from proprietary drivers, which they can't do anything about.
- ▶ Useful for users to check that their system is 100% free
- ▶ Useful for GNU/Linux distributors for their release policy checks.

Possible module license strings

Available license strings explained in `include/linux/module.h`

- ▶ **GPL**
GNU Public License v2 or later
- ▶ **GPL v2**
GNU Public License v2
- ▶ **GPL and additional rights**
- ▶ **Dual BSD/GPL**
GNU Public License v2 or BSD license choice
- ▶ **Dual MPL/GPL**
GNU Public License v2 or Mozilla license choice
- ▶ **Proprietary**
Non free products

Module coding guidelines (1)

- ▶ C includes: you can't use standard C library functions (`printf()`, `strcat()`, etc.). The C library is implemented on top of the kernel, not the opposite.
- ▶ Linux provides some C functions for your convenience, like `printk()`, which interface is pretty similar to `printf()`.

So, only kernel header includes are allowed.

Module coding guidelines (2)

- ▶ Never use floating point numbers in kernel code. Your code may be run on a processor without a floating point unit (like on [arm](#)). Floating point can be emulated by the kernel, but this is very slow.
- ▶ Define all symbols as static, except exported ones (avoid namespace pollution)
- ▶ See [Documentation/CodingStyle](#) for more guidelines
- ▶ It's also good to follow or at least read GNU coding standards: <http://www.gnu.org/prep/standards.html>

Compiling a module

- ▶ The below Makefile should be reusable for any Linux 2.6 module.
- ▶ Just run `make` to build the `hello.ko` file
- ▶ Caution: make sure there is a [Tab] character at the beginning of the `$(MAKE)` line (`make` syntax)

```
# Makefile for the hello module

obj-m := hello.o
KDIR := /lib/modules/$(shell uname -r)/build
PWD := $(shell pwd)
default:
    $(MAKE) -C $(KDIR) SUBDIRS=$(PWD) modules
```

[Tab]!
(no spaces)

Either
- full kernel source directory (configured and compiled)
- or just kernel headers directory (minimum needed)

Example available on <http://free-electrons.com/doc/c/Makefile>

Kernel log

- ▶ Of course, the kernel doesn't store its log into a file!
Files belong to user space.
- ▶ The kernel keeps `printk` messages in a circular buffer
(so that doesn't consume more memory with many messages)
- ▶ Kernel log messages can be accessed from user space through system calls, or through `/proc/kmsg`
- ▶ Kernel log messages are also displayed in the system console.

Accessing the kernel log

Many ways are available!

▶ Watch the system console

▶ `syslogd`

Daemon gathering kernel messages
in `/var/log/messages`

Follow changes by running:

`tail -f /var/log/messages`

Caution: this file grows!

Use `logrotate` to control this

▶ `dmesg`

Found in all systems

Displays the kernel log buffer

▶ `logread`

Same. Often found in small
embedded systems with no
`/var/log/messages` or no
`dmesg`. Implemented by Busybox.

▶ `cat /proc/kmsg`

Waits for kernel messages and
displays them.

Useful when none of the above
user space programs are available
(tiny system)

Using the module

Need to be logged as `root`

▶ Load the module:

```
insmod ./hello.ko
```

▶ You will see the following in the kernel log:

```
Good morrow  
to this fair assembly
```

▶ Now remove the module:

```
rmmod hello
```

▶ You will see:

```
Alas, poor world, what treasure  
hast thou lost!
```

Module utilities (1)

- ▶ `modinfo <module_name>`
`modinfo <module_path>.ko`

Gets information about a module: parameters, license, description. Very useful before deciding to load a module or not.

- ▶ `insmod <module_name>`
`insmod <module_path>.ko`

Tries to load the given module, if needed by searching for its `.ko` file throughout the default locations (can be redefined by the `MODPATH` environment variable).

Module utilities (2)

▶ `modprobe <module_name>`

Most common usage of `modprobe`: tries to load all the modules the given module depends on, and then this module. Lots of other options are available.

▶ `lsmod`

Displays the list of loaded modules

Compare its output with the contents of `/proc/modules!`

Module utilities (3)

▶ `rmmod <module_name>`

Tries to remove the given module

▶ `modprobe -r <module_name>`

Tries to remove the given module and all dependent modules (which are no longer needed after the module removal)

Create your modules with kdevelop

<http://kdevelop.org> - Available in most distros.

```
helloworld.c
#include <linux/kernel.h>
#include <linux/init.h>
#include <linux/module.h>

MODULE_DESCRIPTION("My kernel module");
MODULE_AUTHOR("Michael Opdenacker (michael@free-electrons.com)");
MODULE_LICENSE("$LICENSE$");

static int helloworld_init_module(void)
{
    printk( KERN_DEBUG "Module helloworld init\n" );
    return 0;
}

static void helloworld_exit_module(void)
{
    printk( KERN_DEBUG "Module helloworld exit\n" );
}

module_init(helloworld_init_module);
module_exit(helloworld_exit_module);
```

- ▶ Makes it easy to create a module code skeleton from a ready-made template.
- ▶ Can also be used to compile your module.

Embedded Linux driver development

Driver development Module parameters

hello module with parameters

```
/* hello_param.c */
#include <linux/init.h>
#include <linux/module.h>
#include <linux/moduleparam.h>

MODULE_LICENSE("GPL");

/* A couple of parameters that can be passed in: how many times we say
   hello, and to whom */
static char *whom = "world";
module_param(whom, charp, 0);

static int howmany = 1;
module_param(howmany, int, 0);

static int hello_init(void)
{
    int i;
    for (i = 0; i < howmany; i++)
        printk(KERN_ALERT "(%d) Hello, %s\n", i, whom);
    return 0;
}

static void hello_exit(void)
{
    printk(KERN_ALERT "Goodbye, cruel %s\n", whom);
}

module_init(hello_init);
module_exit(hello_exit);
```

Thanks to
Jonathan Corbet
for the example!

Example available on http://free-electrons.com/doc/c/hello_param.c

Passing module parameters

- ▶ Through `insmod` or `modprobe`:

```
insmod ./hello_param.ko howmany=2 whom=universe
```

- ▶ Through `modprobe`

after changing the `/etc/modprobe.conf` file:

```
options hello_param howmany=2 whom=universe
```

- ▶ Through the kernel command line, when the module is built statically into the kernel:

```
options hello_param.howmany=2 hello_param.whom=universe
```

module name 
module parameter name 
module parameter value 

Declaring a module parameter

```
#include <linux/moduleparam.h>

module_param(
    name,      /* name of an already defined variable */
    type,      /* either byte, short, ushort, int, uint, long,
                ulong, charp, bool or invbool
                (checked at compile time!) */
    perm       /* for /sys/module/<module_name>/<param>
                0: no such module parameter value file */
);
```

Example

```
int irq=5;
module_param(irq, int, S_IRUGO);
```

Declaring a module parameter array

```
#include <linux/moduleparam.h>

module_param_array(
    name,      /* name of an already defined array */
    type,      /* same as in module_param */
    num,       /* number of elements in the array, or NULL (no check?) */
    perm       /* same as in module_param */
);
```

Example

```
static int base[MAX_DEVICES] = { 0x820, 0x840 };
module_param_array(base, int, NULL, 0);
```

Embedded Linux driver development

Driver development Adding sources to the kernel tree

New directory in kernel sources (1)

To add an `acme_drivers/` directory to the kernel sources:

- ▶ Move the `acme_drivers/` directory to the appropriate location in kernel sources
- ▶ Create an `acme_drivers/Kconfig` file
- ▶ Create an `acme_drivers/Makefile` file based on the `Kconfig` variables
- ▶ In the parent directory `Kconfig` file, add `source "acme_drivers/Kconfig"`

New directory in kernel sources (2)

- ▶ In the parent directory `Makefile` file, add
`obj-$(CONFIG_ACME) += acme_drivers/` (just 1 condition)
or
`obj-y += acme_drivers/` (several conditions)
- ▶ Run `make xconfig` and see your new options!
- ▶ Run `make` and your new files are compiled!
- ▶ See [Documentation/kbuild/](#) for details

How to create Linux patches

- ▶ Download the **latest** kernel sources
- ▶ Make a copy of these sources:
`rsync -a linux-2.6.9-rc2/ linux-2.6.9-rc2-patch/`
- ▶ Apply your changes to the copied sources, and test them.
- ▶ Create a patch file:
`diff -Nurp linux-2.6.9-rc2/ \
linux-2.6.9-rc2-patch/ > patchfile`
 - ▶ Always compare the whole source structures
(suitable for `patch -p1`)
 - ▶ Patch file name: should recall what the patch is about

Thanks to Nicolas Rougier (Copyright 2003, <http://webloria.loria.fr/~rougier/>) for the Tux image

Practical lab – Writing modules

Time to start **Lab 4!**

- ▶ Write a kernel module with parameters
- ▶ Setup the environment to compile it
- ▶ Access kernel internals
- ▶ Add a `/proc` interface
- ▶ Add the module sources to the kernel source tree
- ▶ Create a kernel source patch

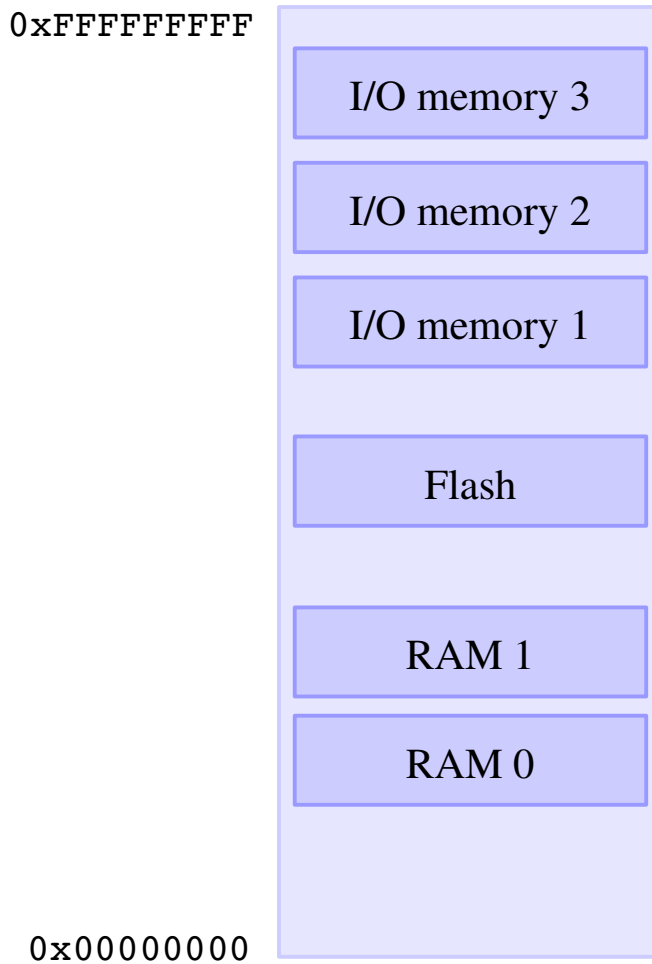

Embedded Linux driver development

Driver development
Memory management

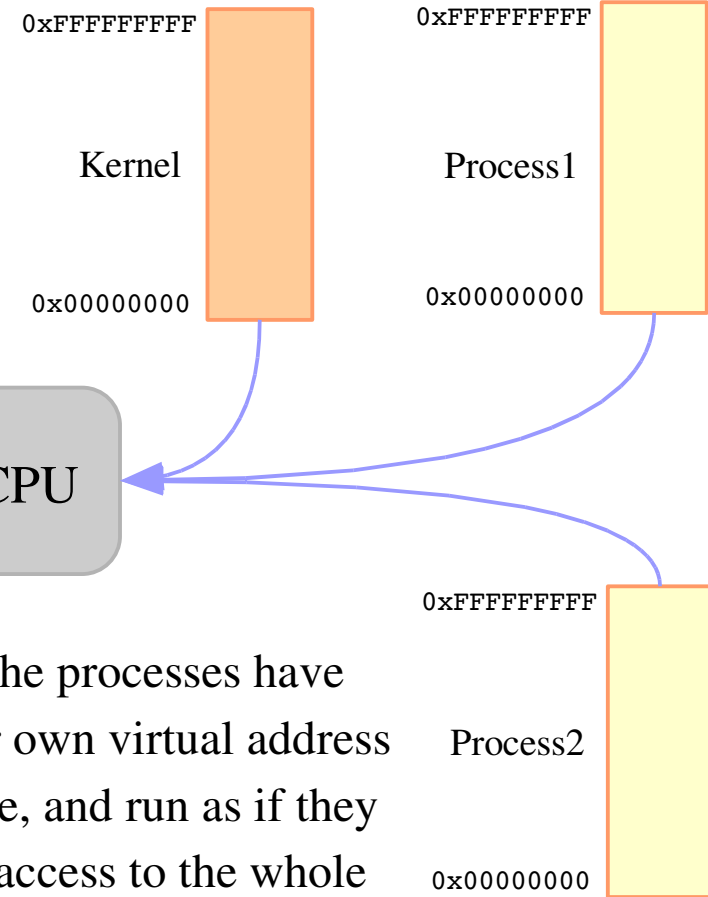

Physical and virtual memory

Physical address space

Virtual address spaces

All the processes have their own virtual address space, and run as if they had access to the whole address space.

kmalloc and kfree

- ▶ Basic allocators, kernel equivalents of `glibc`'s `malloc` and `free`.
- ▶ `static inline void *kmalloc(size_t size, int flags);`
`size`: number of bytes to allocate
`flags`: priority (see next page)
- ▶ `void kfree (const void *objp);`
- ▶ Example:
`data = kmalloc(sizeof(*data), GFP_KERNEL);`
`...`
`kfree(data);`

kmalloc features

- ▶ Quick (unless it's blocked waiting for memory to be freed).
- ▶ Doesn't initialize the allocated area.
You can use `kcalloc` or `kzalloc` to get zeroed memory.
- ▶ The allocated area is contiguous in physical RAM.
- ▶ Allocates by 2^n sizes, and uses a few management bytes.
So, don't ask for 1024 when you need 1000! You'd get 2048!
- ▶ Caution: drivers shouldn't try to `kmalloc` more than 128 KB (upper limit in some architectures).

Main kmalloc flags (1)

Defined in `include/linux/gfp.h` (GFP: `get_free_pages`)

▶ GFP_KERNEL

Standard kernel memory allocation. May block. Fine for most needs.

▶ GFP_ATOMIC

Allocated RAM from interrupt handlers or code not triggered by user processes. Never blocks.

▶ GFP_USER

Allocates memory for user processes. May block. Lowest priority.

Main kmalloc flags (2)

Extra flags (can be added with |)

▶ **__GFP_DMA**

Allocate in DMA zone

▶ **__GFP_REPEAT**

Ask to try harder. May still block, but less likely.

▶ **__GFP_NOFAIL**

Must not fail. Never gives up.
Caution: use only when mandatory!

▶ **__GFP_NORETRY**

If allocation fails, doesn't try to get free pages.

▶ Example:

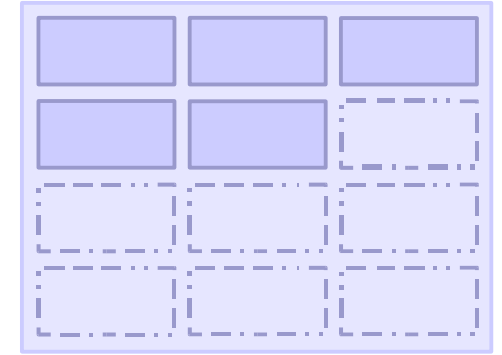

GFP_KERNEL | __GFP_DMA

Slab caches

Also called *lookaside caches*

- ▶ **Slab**: name of the standard Linux memory allocator
- ▶ *Slab caches*: Objects that can hold any number of memory areas of the same size.
- ▶ Optimum use of available RAM and reduced fragmentation.
- ▶ Mainly used in Linux core subsystems: filesystems (open files, inode and file caches...), networking... Live stats on `/proc/slabinfo`.
- ▶ May be useful in device drivers too, though not used so often.
Linux 2.6: used by USB and SCSI drivers.

Slab cache API (1)

▶ `#include <linux/slab.h>`

▶ Creating a cache:

```
cache = kmem_cache_create (  
    name,                /* Name for /proc/slabinfo */  
    size,                /* Cache object size */  
    flags,               /* Options: alignment, DMA... */  
    constructor,        /* Optional, called after each allocation */  
    destructor);        /* Optional, called before each release */
```

Slab cache API (2)

- ▶ Allocating from the cache:

```
object = kmem_cache_alloc (cache, flags);
```

- ▶ Freing an object:

```
kmem_cache_free (cache, object);
```

- ▶ Destroying the whole cache:

```
kmem_cache_destroy (cache);
```

More details and an example in the Linux Device Drivers book:

<http://lwn.net/images/pdf/LDD3/ch08.pdf>

Memory pools

Useful for memory allocations that cannot fail

- ▶ Kind of lookaside cache trying to keep a minimum number of pre-allocated objects ahead of time.
- ▶ Use with care: otherwise can result in a lot of unused memory that cannot be reclaimed! Use other solutions whenever possible.

Memory pool API (1)

- ▶ `#include <linux/mempool.h>`
- ▶ Mempool creation:

```
mempool = mempool_create (  
    min_nr,  
    alloc_function,  
    free_function,  
    pool_data);
```

Memory pool API (2)

- ▶ Allocating objects:

```
object = mempool_alloc (pool, flags);
```

- ▶ Freeing objects:

```
mempool_free (object, pool);
```

- ▶ Resizing the pool:

```
status = mempool_resize (  
    pool, new_min_nr, flags);
```

- ▶ Destroying the pool (caution: free all objects first!):

```
mempool_destroy (pool);
```

Memory pool implementation

Memory pools using slab caches

- ▶ Idea: use slab cache functions to allocate and free objects.
- ▶ The `mempool_alloc_slab` and `mempool_free_slab` functions supply a link with slab cache routines.
- ▶ So, you will find many code examples looking like:

```
cache = kmem_cache_create (...);  
pool = mempool_create (  
    min_nr,  
    mempool_alloc_slab,  
    mempool_free_slab,  
    cache);
```

Allocating by pages

More appropriate when you need big slices of RAM:

▶ `unsigned long get_zeroed_page(int flags);`

Returns a pointer to a free page and fills it up with zeros

▶ `unsigned long __get_free_page(int flags);`

Same, but doesn't initialize the contents

▶ `unsigned long __get_free_pages(int flags,
 unsigned long order);`

Returns a pointer on a memory zone of several contiguous pages in physical RAM.

`order: \log_2 (<number_of_pages>)`

maximum: 8192 KB (`MAX_ORDER=11` in `linux/mmzone.h`)

Freeing pages

- ▶ `void free_page(unsigned long addr);`
- ▶ `void free_pages(unsigned long addr,
 unsigned long order);`

Need to use the same `order` as in allocation.

vmalloc

`vmalloc` can be used to obtain contiguous memory zones in **virtual** address space (even if pages may not be contiguous in physical memory).

- ▶ `void *vmalloc(unsigned long size);`
- ▶ `void vfree(void *addr);`

Memory utilities

▶ `void * memset(void * s, int c, size_t count);`

Fills a region of memory with the given value.

▶ `void * memcpy(void * dest,
 const void *src,
 size_t count);`

Copies one area of memory to another.

Use `memmove` with overlapping areas.

▶ Lots of functions equivalent to standard C library ones defined in `include/linux/string.h`

Memory management - Summary

Small allocations

- ▶ `kmalloc`, `kzalloc`
(and `kfree`!)
- ▶ slab caches
- ▶ memory pools

Bigger allocations

- ▶ `__get_free_page[s]`,
`get_zeroed_page`,
`free_page[s]`
- ▶ `vmalloc`, `vfree`

Libc like memory utilities

- ▶ `memset`, `memcpy`,
`memmove`...

Embedded Linux driver development

Driver development I/O memory and ports

Requesting I/O ports

`/proc/ioprots` example

```
0000-001f : dma1
0020-0021 : pic1
0040-0043 : timer0
0050-0053 : timer1
0060-006f : keyboard
0070-0077 : rtc
0080-008f : dma page reg
00a0-00a1 : pic2
00c0-00df : dma2
00f0-00ff : fpu
0100-013f : pcmcia_socket0
0170-0177 : ide1
01f0-01f7 : ide0
0376-0376 : ide1
0378-037a : parport0
03c0-03df : vga+
03f6-03f6 : ide0
03f8-03ff : serial
0800-087f : 0000:00:1f.0
0800-0803 : PM1a_EVT_BLK
0804-0805 : PM1a_CNT_BLK
0808-080b : PM_TMR
0820-0820 : PM2_CNT_BLK
0828-082f : GPE0_BLK
```

...

▶ `struct resource *request_region(
 unsigned long start,
 unsigned long len,
 char *name);`

Tries to reserve the given region and returns `NULL` if unsuccessful. Example:

▶ `request_region(0x0170, 8, "ide1");`

▶ `void release_region(
 unsigned long start,
 unsigned long len);`

▶ See `include/linux/ioport.h` and `kernel/resource.c`

Reading / writing on I/O ports

The implementation of the below functions and the exact *unsigned* type can vary from platform to platform!

bytes

```
unsigned inb(unsigned port);  
void outb(unsigned char byte, unsigned port);
```

words

```
unsigned inw(unsigned port);  
void outw(unsigned char byte, unsigned port);
```

"long" integers

```
unsigned inl(unsigned port);  
void outl(unsigned char byte, unsigned port);
```

Reading / writing strings on I/O ports

Often more efficient than the corresponding C loop, if the processor supports such operations!

byte strings

```
void insb(unsigned port, void *addr, unsigned long count);  
void outsb(unsigned port, void *addr, unsigned long count);
```

word strings

```
void insw(unsigned port, void *addr, unsigned long count);  
void outsw(unsigned port, void *addr, unsigned long count);
```

long strings

```
void inbsl(unsigned port, void *addr, unsigned long count);  
void outsl(unsigned port, void *addr, unsigned long count);
```

Requesting I/O memory

`/proc/iomem` example

```
00000000-0009efff : System RAM
0009f000-0009ffff : reserved
000a0000-000bffff : Video RAM area
000c0000-000cffff : Video ROM
000f0000-000fffff : System ROM
00100000-3ffadfff : System RAM
    00100000-0030afff : Kernel code
    0030b000-003b4bff : Kernel data
3ffae000-3fffffff : reserved
40000000-400003ff : 0000:00:1f.1
40001000-40001fff : 0000:02:01.0
    40001000-40001fff : yenta_socket
40002000-40002fff : 0000:02:01.1
    40002000-40002fff : yenta_socket
40400000-407fffff : PCI CardBus #03
40800000-40bfffff : PCI CardBus #03
40c00000-40ffffff : PCI CardBus #07
41000000-413fffff : PCI CardBus #07
a0000000-a0000fff : pcmcia_socket0
a0001000-a0001fff : pcmcia_socket1
e0000000-e7ffffff : 0000:00:00.0
e8000000-efffffff : PCI Bus #01
    e8000000-efffffff : 0000:01:00.0
...
```

▶ Equivalent functions with the same interface

▶ `struct resource * request_mem_region(
 unsigned long start,
 unsigned long len,
 char *name);`

▶ `void release_mem_region(
 unsigned long start,
 unsigned long len);`

Choosing I/O ranges

- ▶ I/O port and memory ranges can be passed as module parameters. An easy way to define those parameters is through `/etc/modprobe.conf`.
- ▶ Modules can also try to find free ranges by themselves (making multiple calls to `request_region` or `request_mem_region`).

Mapping I/O memory in virtual memory

- ▶ To access I/O memory, drivers need to have a virtual address that the processor can handle.
- ▶ The `ioremap` functions satisfy this need:

```
#include <asm/io.h>
```

```
void *ioremap(unsigned long phys_addr,  
              unsigned long size);  
void iounmap(void *address);
```

- ▶ Caution: check that `ioremap` doesn't return a `NULL` address!

Differences with standard memory

- ▶ Reads and writes on memory can be cached
- ▶ The compiler may choose to write the value in a cpu register, and may never write it in main memory.
- ▶ The compiler may decide to optimize or reorder read and write instructions.

Avoiding I/O access issues

- ▶ Caching on I/O ports or memory already disabled, either by the hardware or by Linux init code.
- ▶ Memory barriers are supplied to avoid reordering

Hardware independent

```
#include <asm/kernel.h>  
void barrier(void);
```

Only impacts the behavior of the compiler. Doesn't prevent reordering in the processor!

Hardware dependent

```
#include <asm/system.h>  
void rmb(void);  
void wmb(void);  
void mb(void);
```

Safe on all architectures!

Accessing I/O memory

▶ Directly reading from or writing to addresses returned by `ioremap` (“pointer dereferencing”) may not work on some architectures.

▶ Use the below functions instead. They are always portable and safe:

```
unsigned int ioread8(void *addr); (same for 16 and 32)
```

```
void iowrite8(u8 value, void *addr); (same for 16 and 32)
```

▶ To read or write a series of values:

```
void ioread8_rep(void *addr, void *buf, unsigned long count);
```

```
void iowrite8_rep(void *addr, const void *buf, unsigned long count);
```

▶ Other useful functions:

```
void memset_io(void *addr, u8 value, unsigned int count);
```

```
void memcpy_fromio(void *dest, void *source, unsigned int count);
```

```
void memcpy_toio(void *dest, void *source, unsigned int count);
```

/dev/mem

- ▶ Used to provide user-space applications with direct access to physical addresses.
- ▶ Actually only works with addresses that are non-RAM (I/O memory) or with addresses that have some special flag set in the kernel's data structures. Fortunately, doesn't provide access to any address in physical RAM!
- ▶ Used by applications such as the X server to write directly to device memory.

Embedded Linux driver development

Driver development Character drivers

Usefulness of character drivers

- ▶ Except for storage device drivers, most drivers for devices with input and output flows are implemented as character drivers.
- ▶ So, most drivers you will face will be character drivers
You will regret if you sleep during this part!

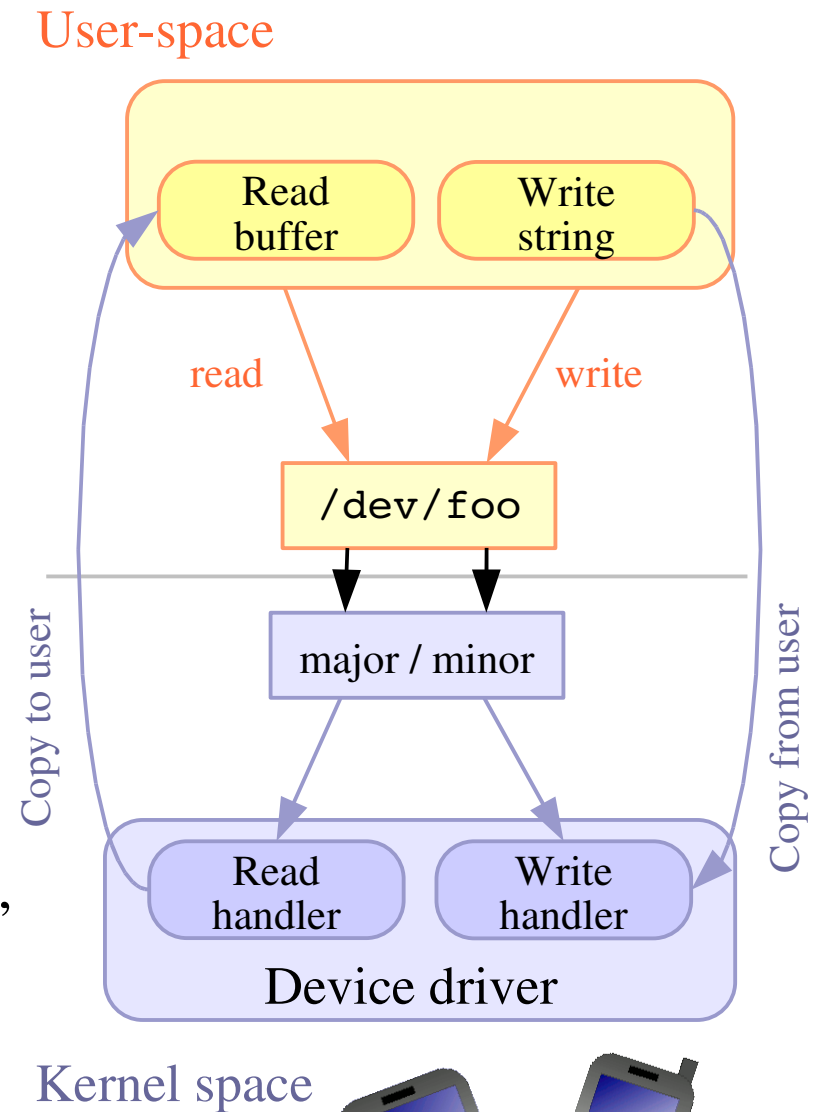

Creating a character driver

User-space needs

- ▶ The name of a device file in `/dev` to interact with the device driver through regular file operations (open, read, write, close...)

The kernel needs

- ▶ To know which driver is in charge of device files with a given major / minor number pair
- ▶ For a given driver, to have handlers (“*file operations*”) to execute when user-space opens, reads, writes or closes the device file.

Declaring a character driver

Device number registration

- ▶ Need to register one or more device numbers (major / minor pairs), depending on the number of devices managed by the driver.
- ▶ Need to find free ones!

File operations registration

- ▶ Need to register handler functions called when user space programs access the device files: `open`, `read`, `write`, `ioctl`, `close`...

Information on registered devices

Registered devices are visible in `/proc/devices`:

```
Character devices:      Block devices:
1 mem                  1 ramdisk
4 /dev/vc/0            3 ide0
4 tty                  8 sd
4 ttyS                 9 md
5 /dev/tty             22 ide1
5 /dev/console         65 sd
5 /dev/ptmx           66 sd
6 lp                   67 sd
7 vcs                  68 sd
10 misc                69 sd
13 input
14 sound
...
```

Major
number

Registered
name

Can be used to
find free major
numbers

dev_t structure

Kernel data structure to represent a major / minor pair

▶ Defined in `<linux/kdev_t.h>`

Linux 2.6: 32 bit size (major: 12 bits, minor: 20 bits)

▶ Macro to create the structure:

```
MKDEV(int major, int minor);
```

▶ Macro to extract the numbers:

```
MAJOR(dev_t dev);
```

```
MINOR(dev_t dev);
```

Allocating fixed device numbers

```
#include <linux/fs.h>

int register_chrdev_region(
    dev_t from,           /* Starting device number */
    unsigned count,      /* Number of device numbers */
    const char *name);   /* Registered name */
```

Returns 0 if the allocation was successful.

Example

```
if (register_chrdev_region(MKDEV(202, 128),
                           acme_count, "acme")) {
    printk(KERN_ERR "Failed to allocate device number\n");
    ...
}
```

Dynamic allocation of device numbers

Safer: have the kernel allocate free numbers for you!

```
#include <linux/fs.h>

int alloc_chrdev_region(
    dev_t *dev,           /* Output: starting device number */
    unsigned baseminor, /* Starting minor number, usually 0 */
    unsigned count,      /* Number of device numbers */
    const char *name);  /* Registered name */
```

Returns 0 if the allocation was successful.

Example

```
if (alloc_chrdev_region(&acme_dev, 0, acme_count, "acme")) {
    printk(KERN_ERR "Failed to allocate device number\n");
    ...
}
```

Creating device files

- ▶ Issue: you can no longer create `/dev` entries in advance!
You have to create them on the fly after loading the driver according to the allocated major number.
- ▶ Trick: the script loading the module can then use `/proc/devices`:

```
module=foo; name=foo; device=foo
rm -f /dev/$device
insmod $module.ko
major=`awk "\\$2==\"$name\" {print \\$1}" /proc/devices`
mknod /dev/$device c $major 0
```

Caution: back quotes!

file operations (1)

Before registering character devices, you have to define `file_operations` (called *fops*) for the device files.

Here are the main ones:

```
▶ int (*open) (  
    struct inode *, /* Corresponds to the device file */  
    struct file *); /* Corresponds to the open file descriptor */
```

Called when user-space opens the device file.

```
▶ int (*release) (  
    struct inode *,  
    struct file *);
```

Called when user-space closes the file.

The file structure

Is created by the kernel during the `open` call. Represents open files. Pointers to this structure are usually called "*files*".

▶ `mode_t f_mode;`

The file opening mode (`FMODE_READ` and/or `FMODE_WRITE`)

▶ `loff_t f_pos;`

Current offset in the file.

▶ `struct file_operations *f_op;`

Allows to change file operations for different open files!

▶ `struct dentry *f_dentry`

Useful to get access to the inode: `filp->f_dentry->d_inode`.

file operations (2)

```
▶ ssize_t (*read) (  
    struct file *,           /* Open file descriptor */  
    char *,                 /* User-space buffer to fill up */  
    size_t,                 /* Size of the user-space buffer */  
    loff_t *);             /* Offset in the open file */
```

Called when user-space reads from the device file.

```
▶ ssize_t (*write) (  
    struct file *,           /* Open file descriptor */  
    const char *,          /* User-space buffer to write to the device */  
    size_t,                 /* Size of the user-space buffer */  
    loff_t *);             /* Offset in the open file */
```

Called when user-space writes to the device file.

Exchanging data with user-space (1)

In driver code, you can't just `memcpy` between an address supplied by user-space and the address of a buffer in kernel-space!

- ▶ Correspond to completely different address spaces (thanks to virtual memory)
- ▶ The user-space address may be swapped out to disk
- ▶ The user-space address may be invalid (user space process trying to access unauthorized data)

Exchanging data with user-space (2)

You must use dedicated functions such as the following ones in your `read` and `write` file operations code:

```
include <asm/uaccess.h>
```

```
unsigned long copy_to_user (void __user *to,  
                             const void *from,  
                             unsigned long n);
```

```
unsigned long copy_from_user (void *to,  
                              const void __user *from,  
                              unsigned long n);
```

Make sure that these functions return 0!

Another return value would mean that they failed.

file operations (3)

▶ `int (*ioctl) (struct inode *, struct file *,
 unsigned int, unsigned long);`

Can be used to send specific commands to the device, which are neither reading nor writing (e.g. formatting a disk, configuration changes).

▶ `int (*mmap) (struct file *,
 struct vm_area_struct);`

Asking for device memory to be mapped into the address space of a user process

▶ `struct module *owner;`

Used by the kernel to keep track of who's using this structure and count the number of users of the module.

file operations definition example (1)

```
static ssize_t
acme_read(struct file *file, char __user *buf, size_t count, loff_t * ppos)
{
    /* The hwdata address corresponds to a device I/O memory area */
    /* of size hwdata_size, obtained with ioremap() */

    /* Number of bytes left to read in the open file */
    remaining_bytes = min(hwdata_size - (*ppos), count);

    if (remaining_bytes == 0) {
        /* All read, returning 0 (End Of File) */
        return 0;
    }

    if (copy_to_user(buf /* to */, *ppos+hwdata /* from */, remaining_bytes)) {
        return -EFAULT;
    } else {
        /* Increase the position in the open file */
        *ppos += remaining_bytes;
        return remaining_bytes;
    }
}
```

Read method

Piece of code available on

http://free-electrons.com/doc/c/acme_read.c

file operations definition example (2)

```
static ssize_t
acme_write(struct file *file, const char __user *buf, size_t count, loff_t * ppos)
{
    /* Assuming that hwdata corresponds to a physical address range */
    /* of size hwdata_size, obtained with ioremap() */

    /* Number of bytes left to write to the device */
    remaining_bytes = min(hwdata_size - (*ppos), count);

    if (remaining_bytes == 0) {
        /* All written, returning 0 */
        return 0;
    }

    if (copy_from_user(*ppos+hwdata /* to */, buf /* from */, remaining_bytes)) {
        return -EFAULT;
    } else {
        /* Increase the position in the open file */
        *ppos += remaining_bytes;
        return remaining_bytes;
    }
}
```

Write method

Piece of code available on

http://free-electrons.com/doc/c/acme_write.c

Embedded Linux kernel and driver development

file operations definition example (3)

Defining a file operations structure

```
include <linux/fs.h>

static struct file_operations acme_fops =
{
    .owner = THIS_MODULE,
    .read = acme_read,
    .write = acme_write,
};
```

You just need to supply the functions you implemented!
Defaults for other functions (such as `open`, `release...`)
are fine if you do not implement anything special.

Character device registration (1)

- ▶ The kernel represents character drivers with a `cdev` structure
- ▶ Declare this structure globally (within your module):

```
#include <linux/cdev.h>
static struct cdev *acme_cdev;
```
- ▶ In the init function, allocate the structure and set its file operations:

```
acme_cdev = cdev_alloc();
acme_cdev->ops = &acme_fops;
acme_cdev->owner = THIS_MODULE;
```

Character device registration (2)

- ▶ Then, now that your structure is ready, add it to the system:

```
int cdev_add(  
    struct cdev *p,      /* Character device structure */  
    dev_t dev,          /* Starting device major / minor number */  
    unsigned count);   /* Number of devices */
```

- ▶ Example (continued):

```
if (cdev_add(acme_cdev, acme_dev, acme_count)) {  
    printk (KERN_ERR "Char driver registration failed\n");  
    ...  
}
```

Character device unregistration

- ▶ First delete your character device:

```
void cdev_del(struct cdev *p);
```

- ▶ Then, and only then, free the device number:

```
void unregister_chrdev_region(dev_t from,  
unsigned count);
```

- ▶ Example (continued):

```
cdev_del(acme_cdev);  
unregister_chrdev_region(acme_dev, acme_count);
```

Linux error codes

Try to report errors with error numbers as accurate as possible!
Fortunately, macro names are explicit and you can remember them quickly.

- ▶ Generic error codes:
`include/asm-generic/errno-base.h`
- ▶ Platform specific error codes:
`include/asm/errno.h`

Character driver summary

Character driver writer

- Define the file operations callbacks for the device file: `read`, `write`, `ioctl`...
- In the module init function, get major and minor numbers with `alloc_chrdev_region()`, init a `cdev` structure with your file operations and add it to the system with `cdev_add()`.
- In the module exit function, call `cdev_del()` and `unregister_chrdev_region()`

Kernel

System administration

- Load the character driver module
 - In `/proc/devices`, find the major number it uses.
 - Create the device file with this major number
- The device file is ready to use!

User-space

System user

- Open the device file, read, write, or send `ioctl`'s to it.

Kernel

- Executes the corresponding file operations

Kernel

Practical lab – Character drivers

Time to start **Lab 5!**

- ▶ Write simple `file_operations`, for a character device, including `ioctl` controls
- ▶ Get a free device number
- ▶ Register the character device
- ▶ Use the `kmalloc` and `kfree` utilities
- ▶ Exchange data with userspace

Embedded Linux driver development

Driver development Debugging

Usefulness of a serial port

- ▶ Most processors feature a serial port interface (usually very well supported by Linux). Just need this interface to be connected to the outside.
- ▶ Easy way of getting the first messages of an early kernel version, even before it boots. A minimum kernel with only serial port support is enough.
- ▶ Once the kernel is fixed and has completed booting, possible to access a serial console and issue commands.
- ▶ The serial port can also be used to transfer files to the target.

When you don't have a serial port

On the host

- ▶ Not an issue. You can get a USB to serial converter. Usually very well supported on Linux and roughly costs \$20. The device appears as `/dev/ttyUSB0` on the host.

On the target

- ▶ Check whether you have an IrDA port. It's usually a serial port too.
- ▶ If you have an Ethernet adapter, try with it
- ▶ You may also try to manually hook-up the processor serial interface (check the electrical specifications first!)

Debugging with printk

- ▶ Universal debugging technique used since the beginning of programming (first found in cavemen drawings)
- ▶ Printed or not in the console or `/var/log/messages` according to the priority. This is controlled by the `loglevel` kernel parameter, or through `/proc/sys/kernel/printk` (see [Documentation/sysctl/kernel.txt](#))
- ▶ Available priorities (`include/linux/kernel.h`):

```
#define KERN_EMERG      "<0>"    /* system is unusable */
#define KERN_ALERT     "<1>"    /* action must be taken immediately */
#define KERN_CRIT      "<2>"    /* critical conditions */
#define KERN_ERR       "<3>"    /* error conditions */
#define KERN_WARNING   "<4>"    /* warning conditions */
#define KERN_NOTICE    "<5>"    /* normal but significant condition */
#define KERN_INFO      "<6>"    /* informational */
#define KERN_DEBUG     "<7>"    /* debug-level messages */
```

Debugging with /proc or /sys (1)

Instead of dumping messages in the kernel log, you can have your drivers make information available to user space

- ▶ Through a file in `/proc` or `/sys`, which contents are handled by callbacks defined and registered by your driver.
- ▶ Can be used to show any piece of information about your device or driver.
- ▶ Can also be used to send data to the driver or to control it.
- ▶ Caution: anybody can use these files.

You should remove your debugging interface in production!

Debugging with /proc or /sys (2)

Examples

- ▶ `cat /proc/acme/stats` (dummy example)
Displays statistics about your acme driver.
- ▶ `cat /proc/acme/globals` (dummy example)
Displays values of global variables used by your driver.
- ▶ `echo 600000 > /sys/devices/system/cpu/cpu0/cpufreq/scaling_setspeed`
Adjusts the speed of the CPU (controlled by the `cpufreq` driver).

Debugging with ioctl

- ▶ Can use the `ioctl()` system call to query information about your driver (or device) or send commands to it.
- ▶ This calls the `ioctl` file operation that you can register in your driver.
- ▶ Advantage: your debugging interface is not public. You could even leave it when your system (or its driver) is in the hands of its users.

Debugging with gdb

- ▶ Schrödinger penguin principle.

If you execute the kernel from a debugger on the same machine, this will interfere with the kernel behavior.

- ▶ However, you can access the current kernel state with `gdb`:

```
gdb /usr/src/linux/vmlinux /proc/kcore
```

uncompressed kernel kernel address space

- ▶ You can access kernel structures, follow pointers... (read only!)

- ▶ Requires the kernel to be compiled with `CONFIG_DEBUG_INFO`
(Kernel hacking section)

kgdb kernel patch

<http://kgdb.linsyssoft.com/>

- ▶ The execution of the patched kernel is fully controlled by **gdb** from another machine, connected through a serial line.
- ▶ Can do almost everything, including inserting breakpoints in interrupt handlers.
- ▶ Supported architectures: **i386**, **x86_64**, **ppc** and **s390**.

Kernel crash analysis with kexec

- ▶ **kexec** system call: makes it possible to call a new kernel, without rebooting and going through the BIOS / firmware.
- ▶ Idea: after a kernel panic, make the kernel automatically execute a new, clean kernel from a reserved location in RAM, to perform post-mortem analysis of the memory of the crashed kernel.
- ▶ See [Documentation/kdump/kdump.txt](#) in the kernel sources for details.

Decrypting oops messages

- ▶ You often get kernel oops messages when you develop drivers (dereferencing null pointers, illegal accesses to memory...). They give raw information about the function call stack and CPU registers.
- ▶ You can make these messages more explicit in your development kernel, for example by replacing raw addresses by symbol names, by setting:

```
# General Setup  
CONFIG_KALLSYMS=y
```
- ▶ Replaces the `ksymoops` tool which shouldn't be used any more with Linux 2.6

```

Debugging with Kprobes

<http://sourceware.org/systemtap/kprobes/>

- ▶ Fairly simple way of inserting breakpoints in kernel routines
- ▶ Unlike `printk` debugging, you neither have to recompile nor reboot your kernel. You only need to compile and load a dedicated module to declare the address of the routine you want to probe.
- ▶ Non disruptive, based on the kernel interrupt handler
- ▶ `Kprobes` even lets you modify registers and global kernel internals.
- Supported architectures: `i386`, `x86_64`, `ppc64` and `sparc64`

Nice overviews: <http://lwn.net/Articles/132196/>

and <http://www-106.ibm.com/developerworks/library/l-kprobes.html>

Kernel debugging tips

- ▶ If your kernel doesn't boot yet or hangs without any message, it can help to activate Low Level debugging (Kernel Hacking section, **only available on arm**):
`CONFIG_DEBUG_LL=y`
- ▶ More about kernel debugging in the free [Linux Device Drivers book](#) (References section)!

Embedded Linux driver development

Driver development Concurrent access to resources

Sources of concurrency issues

The same resources can be accessed by several kernel processes in parallel, causing potential concurrency issues

- ▶ Several user-space programs accessing the same device data or hardware. Several kernel processes could execute the same code on behalf of user processes running in parallel.
- ▶ Multiprocessing: the same driver code can be running on another processor. This can also happen with single CPUs with hyperthreading.
- ▶ Kernel preemption, interrupts: kernel code can be interrupted at any time (just a few exceptions), and the same data may be access by another process before the execution continues.

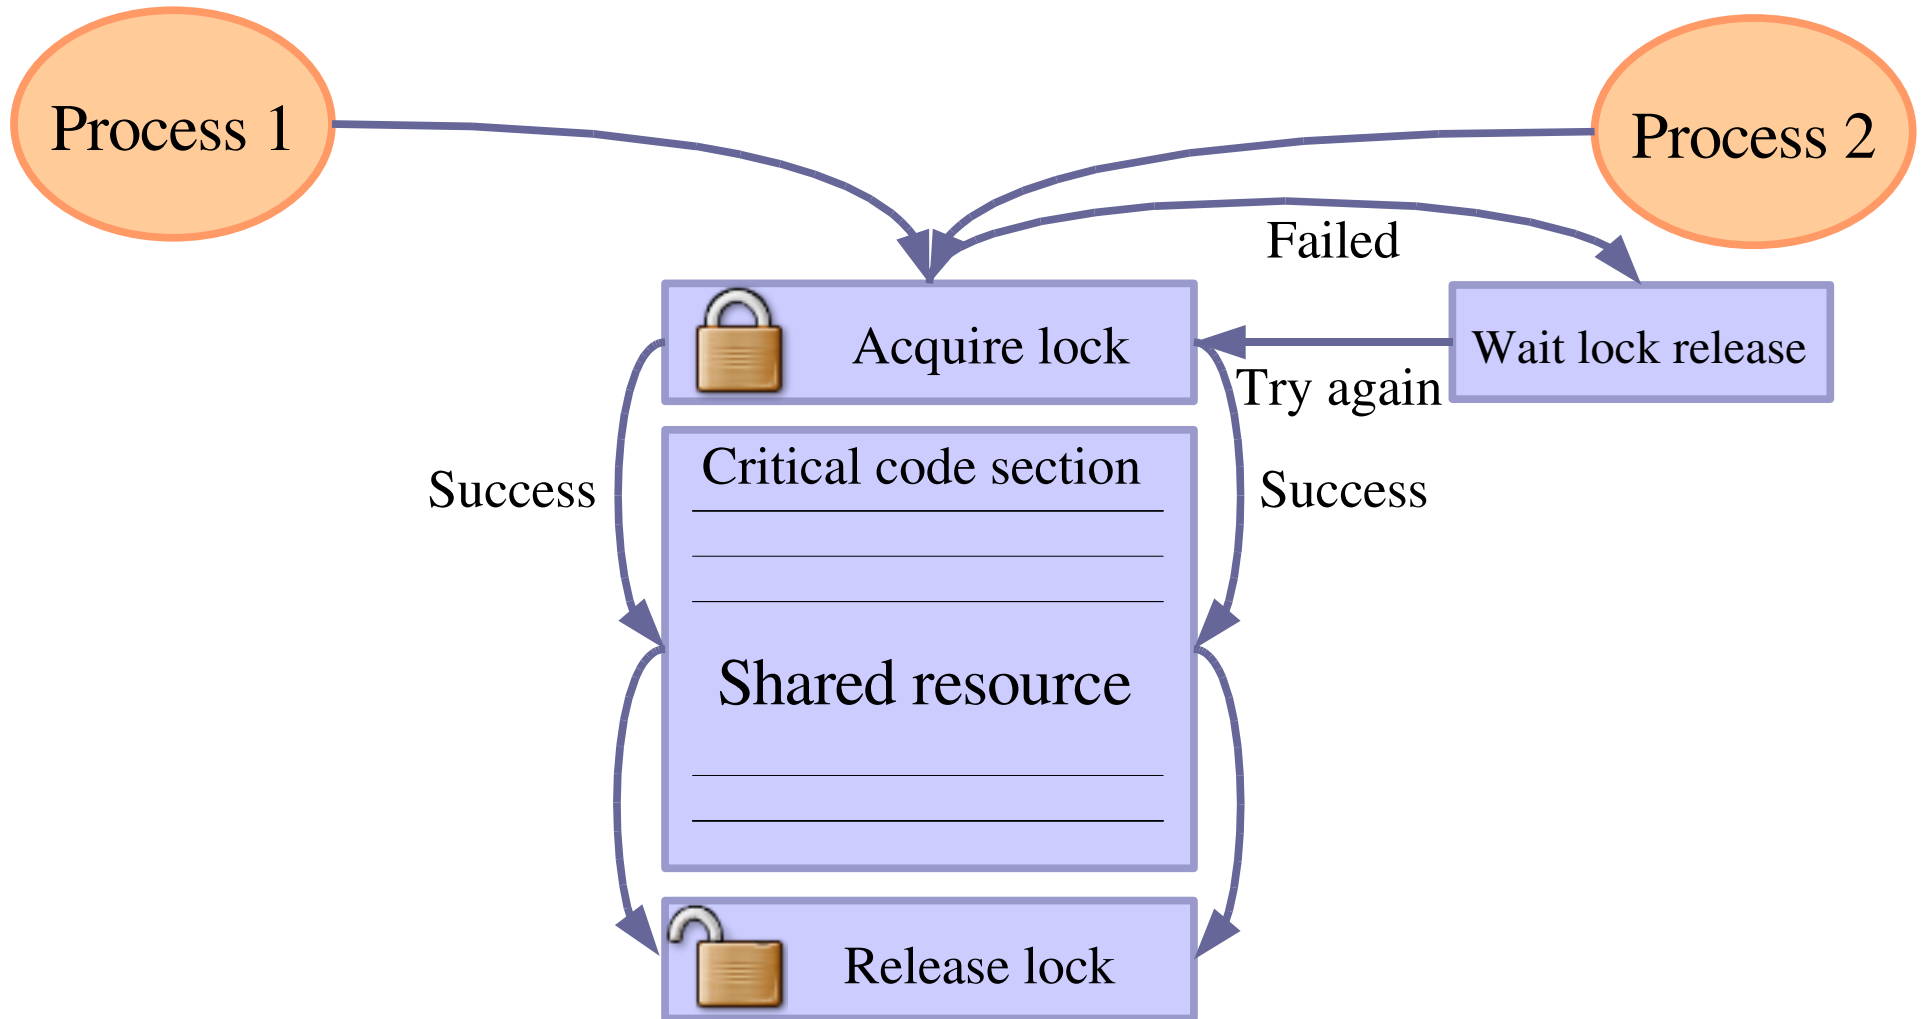

Avoiding concurrency issues

- ▶ Avoid using global variables and shared data whenever possible (cannot be done with hardware resources)
- ▶ Don't make resources available to other kernel processes until they are ready to be used.
- ▶ Use techniques to manage concurrent access to resources.

See Rusty Russell's Unreliable Guide To Locking
[Documentation/DocBook/kernel-locking/](#)
in the kernel sources.

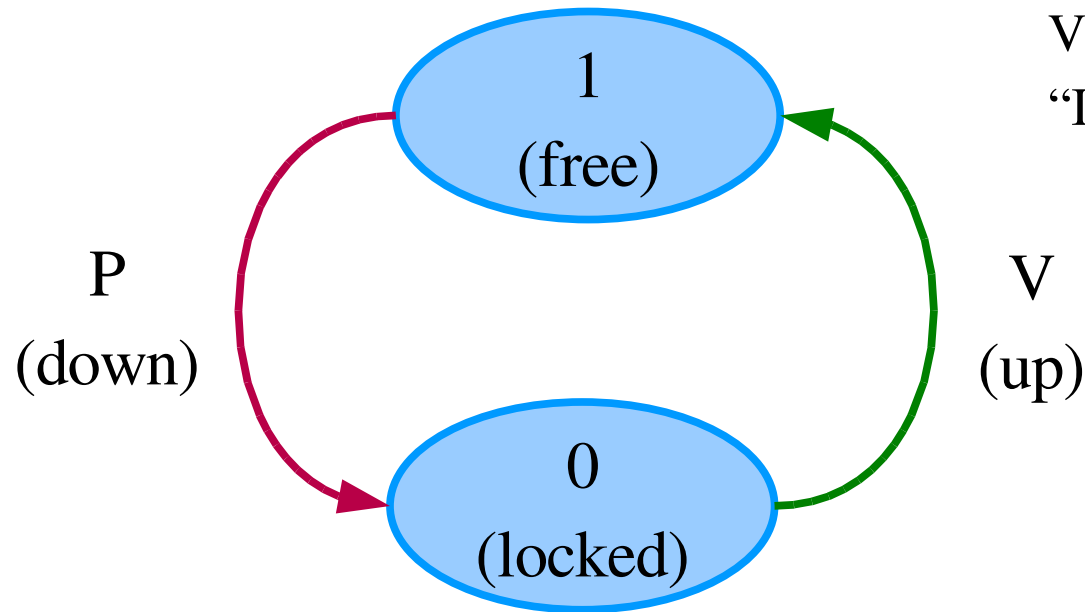

Concurrency protection with semaphores

Kernel semaphores

Also called “mutexes” (**M**utual **E**xclusion)

V: “Verhoog”
“Increment” in Dutch

P: “Probeer”

“Try” (to decrement) in Dutch

Initializing a semaphore

- ▶ Statically

```
DECLARE_MUTEX(name);  
DECLARE_MUTEX_LOCKED(name);
```

- ▶ Dynamically

```
void init_MUTEX(struct semaphore *sem);  
void init_MUTEX_LOCKED(struct semaphore *sem);
```

locking and unlocking semaphores

▶ `void down (struct semaphore *sem);`

Decrements the semaphore if set to 1, waits otherwise.

Caution: can't be interrupted, causing processes you cannot kill!

▶ `int down_interruptible (struct semaphore *sem);`

Same, but can be interrupted. If interrupted, returns a non zero value and doesn't hold the semaphore. Test the return value!!!

▶ `int down_trylock (struct semaphore *sem);`

Never waits. Returns a non zero value if the semaphore is not available.

▶ `void up (struct semaphore *sem);`

Releases the semaphore. Make sure you do it as soon as possible!

Reader / writer semaphores

Allow shared access by unlimited readers, or by only 1 writer. Writers get priority.

```
void init_rwsem (struct rw_semaphore *sem);  
void down_read (struct rw_semaphore *sem);  
int down_read_trylock (struct rw_semaphore *sem);  
int up_read (struct rw_semaphore *sem);  
void down_write (struct rw_semaphore *sem);  
int down_write_trylock (struct rw_semaphore *sem);  
int up_write (struct rw_semaphore *sem);
```

Well suited for rare writes, holding the semaphore briefly. Otherwise, readers get *starved*, waiting too long for the semaphore to be released.

When to use semaphores

- ▶ Before and after accessing shared resources
- ▶ Before and after making other resources available to other parts of the kernel or to user-space (typically and module initialization).
- ▶ In situations when sleeping is allowed.

Spinlocks

- ▶ Locks to be used for code that can't sleep (critical sections, interrupt handlers... Be very careful not to call functions which can sleep!
- ▶ Intended for multiprocessor systems
- ▶ Spinlocks are not interruptible, don't sleep and keep spinning in a loop until the lock is available.
- ▶ Spinlocks cause kernel preemption to be disabled on the CPU executing them.
- ▶ May require interrupts to be disabled too.

Initializing spinlocks

▶ Static

```
spinlock_t my_lock = SPIN_LOCK_UNLOCKED;
```

▶ Dynamic

```
void spin_lock_init (spinlock_t *lock);
```

Using spinlocks

```
void spin_[un]lock (spin_lock_t *lock);
```

```
void spin_[un]lock_irqsave (spin_lock_t *lock,  
    unsigned long flags);
```

Disables IRQs on the local CPU

```
void spin_[un]lock_irq (spin_lock_t *lock);
```

Disables IRQs without saving flags. When you're sure that nobody already disabled interrupts.

```
void spin_[un]lock_bh (spin_lock_t *lock);
```

Disables software interrupts, but not hardware ones

Note that reader / writer spinlocks also exist.

Deadlock situations

They can lock up your system. Make sure they never happen!

Don't call a function that can try to get access to the same lock

Holding multiple locks is risky!

Alternatives to locking

As we have just seen, locking can have a strong negative impact on system performance. In some situations, you could do without it.

- ▶ By using lock-free algorithms like Read Copy Update (RCU).
RCU API available in the kernel
(See <http://en.wikipedia.org/wiki/RCU>).
- ▶ When available, use atomic operations.

Atomic variables

- ▶ Useful when the shared resource is an integer value
- ▶ Even an instruction like `n++` is not guaranteed to be atomic on all processors!

Header

- ▶ `#include <asm/atomic.h>`

Type

- ▶ `atomic_t`
contains a signed integer (at least 24 bits)

Atomic operations (main ones)

- ▶ Set or read the counter:

```
atomic_set (atomic_t *v, int i);  
int atomic_read (atomic_t *v);
```

- ▶ Operations without return value:

```
void atomic_inc (atomic_t *v);  
void atomic_dec (atomic_t *v);  
void atomic_add (int i, atomic_t *v);  
void atomic_sub (int i, atomic_t *v);
```

- ▶ Similar functions testing the result:

```
int atomic_inc_and_test (...);  
int atomic_dec_and_test (...);  
int atomic_sub_and_test (...);
```

- ▶ Functions returning the new value:

```
int atomic_inc_and_return (...);  
int atomic_dec_and_return (...);  
int atomic_add_and_return (...);  
int atomic_sub_and_return (...);
```

Atomic bit operations

- ▶ Supply very fast, atomic operations
- ▶ On most platforms, apply to an `unsigned long` type.
Apply to a `void` type on a few others.

- ▶ Set, clear, toggle a given bit:

```
void set_bit(int nr, unsigned long * addr);  
void set_bit(int nr, unsigned long * addr);
```

- ▶ Test bit value:

```
int test_bit(int nr, unsigned long *addr);
```

- ▶ Test and modify (return the previous value):

```
int test_and_set_bit (...);  
int test_and_clear_bit (...);  
int test_and_change_bit (...);
```

Embedded Linux driver development

Driver development Sleeping

How to sleep (1)

Sleeping is needed when a user process is waiting for data which are not ready yet. The process then puts itself in a waiting queue.

▶ Static queue declaration

```
DECLARE_WAIT_QUEUE_HEAD (module_queue);
```

▶ Dynamic queue declaration

```
wait_queue_head_t queue;  
init_waitqueue_head(&queue);
```

How to sleep (2)

Several ways to make a kernel process sleep

▶ `wait_event(queue, condition);`

Sleeps until the given boolean expression is true.

Caution: can't be interrupted (i.e. by killing the client process in user-space)

▶ `wait_event_interruptible(queue, condition);`

Can be interrupted

▶ `wait_event_timeout(queue, condition, timeout);`

Sleeps and automatically wakes up after the given timeout.

▶ `wait_event_interruptible_timeout(queue, condition, timeout);`

Same as above, interruptible.

Waking up!

Typically done by interrupt handlers when data sleeping processes are waiting for are available.

▶ `wake_up(&queue);`

Wakes up all the waiting processes on the given queue

▶ `wake_up_interruptible(&queue);`

Does the same job. Usually called when processes waited using `wait_event_interruptible`.

Embedded Linux driver development

Driver development Interrupt management

Need for interrupts

- ▶ Internal processor interrupts used by the processor, for example for multi-task scheduling.
- ▶ External interrupts needed because most internal and external devices are slower than the processor. Better not keep the processor waiting for input data to be ready or data to be output. When the device is ready again, it sends an interrupt to get the processor attention again.

Registering an interrupt handler (1)

Defined in `include/linux/interrupt.h`

```
▶ int request_irq(
    unsigned int irq,                requested irq channel
    irqreturn_t (*handler) (int, void *,
    struct pt_regs *),              interrupt handler
    unsigned long irq_flags,         option mask
    const char * devname,           registered name
    void *dev_id);                  pointer to some handler data
                                   must be unique for shared irqs!
```

```
▶ void free_irq( unsigned int irq, void *dev_id);
```

Registering an interrupt handler (2)

`irq_flags` bit values (can be combined!)

▶ `SA_INTERRUPT`

"Quick" interrupt handler. Run with disabled interrupts.

Shouldn't need to be used except in specific cases (such as timer interrupts)

▶ `SA_SHIRQ`

The interrupt channel can be shared by several devices.

▶ `SA_SAMPLE_RANDOM`

Interrupts can be used to contribute to the system entropy pool used by `/dev/random` and `/dev/urandom`. Useful to generate good random numbers. Don't use this if the interrupt behavior of your device is predictable!

When to register the handler

- ▶ Either at driver initialization time:
consumes lots of IRQ channels!
- ▶ Or at device open time (first call to the `open` file operation):
better for saving free IRQ channels.
Need to count the number of times the device is opened, to
be able to free the IRQ channel when the device is no longer
in use.

Information on installed handlers

```
/proc/interrupts
```

```
                CPU0
0:                5616905      XT-PIC  timer # Registered name

NMI:                 0      # Non Maskable Interrupts
ERR:                 0
```

Total number of interrupts

```
cat /proc/stat | grep intr
```

```
intr 8190767 6092967 10377 0 1102775 5 2 0 196 ...
```

Total number of interrupts	IRQ1 total	IRQ2 total	IRQ3 ...
-------------------------------	---------------	---------------	-------------

Interrupt channel detection (1)

- ▶ Some devices announce their IRQ channel in a register
- ▶ Some devices have always the same behavior: you end up knowing their IRQ channel
- ▶ Manual detection
 - ▶ Register your interrupt handler for all possible channels
 - ▶ Ask for an interrupt
 - ▶ Let the called interrupt handler store the IRQ number in a global variable.
 - ▶ Try again if no interrupt was received
 - ▶ Unregister unused interrupt handlers.

Interrupt channel detection (2)

Kernel detection utilities

- ▶ `mask = probe_irq_on();`
- ▶ Activate interrupts on the device
- ▶ Deactivate interrupts on the device
- ▶ `irq = probe_irq_off(mask);`
 - ▶ `> 0`: unique IRQ number found
 - ▶ `= 0`: no interrupt. Try again!
 - ▶ `< 0`: several interrupts happened. Try again!

The interrupt handler's job

- ▶ Acknowledge the interrupt to the device
(otherwise no more interrupts will be generated)
- ▶ Read/write data from/to the device
- ▶ Wake up any waiting process waiting for the completion of this read/write operation:
`wake_up_interruptible(&module_queue);`

Interrupt handler constraints

- ▶ Not run from a user context:
Can't transfer data to and from user space
- ▶ Can't run actions that may sleep:
Need to allocate memory with `GFP_ATOMIC`
- ▶ Can't call `schedule()`
- ▶ Have to complete their job quickly enough:
they shouldn't block interrupts for too long.

Interrupt handler prototype

```
irqreturn_t (*handler) (  
    int, /* irq number */  
    void *dev_id, /* Pointer used to keep track of the  
                  corresponding device. Useful  
                  when several devices are  
                  managed by the same module */  
    struct pt_regs *regs /* cpu register snapshot, rarely  
                          needed*/  
);
```

Return value:

- ▶ **IRQ_HANDLED**: recognized and handled interrupt
- ▶ **IRQ_NONE**: not on a device managed by the module. Useful to share interrupt channels and/or report spurious interrupts to the kernel.

Top half and bottom half processing (1)

- ▶ *Top half*: the interrupt handler must complete as quickly as possible. Once it acknowledged the interrupt, it just schedules the lengthy rest of the job taking care of the data, for a later execution.
- ▶ *Bottom half*: completing the rest of the interrupt handler job. Handles data, and then wakes up any waiting user process. Best implemented by *tasklets*.

top half and bottom half processing (2)

- ▶ Declare the tasklet in the module source file:

```
DECLARE_TASKLET (module_tasklet,      /* name */  
                module_do_tasklet, /* function */  
                0                    /* data */  
                );
```

- ▶ Schedule the tasklet in the top half part (interrupt handler):

```
tasklet_schedule(&module_do_tasklet);
```

Interrupt management summary

Device driver

- ▶ When the device file is first open, register an interrupt handler for the device's interrupt channel.

Interrupt handler

- ▶ Called when an interrupt is raised.
- ▶ Acknowledge the interrupt
- ▶ If needed, schedule a tasklet taking care of handling data. Otherwise, wake up processes waiting for the data.

Tasklet

- ▶ Process the data
- ▶ Wake up processes waiting for the data

Device driver

- ▶ When the device is no longer opened by any process, unregister the interrupt handler.

Practical lab – Interrupts

Time to start **Lab 6!**

- ▶ Implement a simple interrupt handler
- ▶ Register this handler on a shared interrupt line on your GNU/Linux PC.
- ▶ See how Linux handles shared interrupt lines.

Embedded Linux driver development

Driver development mmap

mmap (1)

Possibility to have parts of the virtual address space of a program mapped to the contents of a file!

```
> cat /proc/1/maps (init process)
```

start	end	perm	offset	major:minor	inode	mapped file name
00771000-0077f000	r-xp	00000000	03:05	1165839	/lib/libselinux.so.1	
0077f000-00781000	rw-p	0000d000	03:05	1165839	/lib/libselinux.so.1	
0097d000-00992000	r-xp	00000000	03:05	1158767	/lib/ld-2.3.3.so	
00992000-00993000	r--p	00014000	03:05	1158767	/lib/ld-2.3.3.so	
00993000-00994000	rw-p	00015000	03:05	1158767	/lib/ld-2.3.3.so	
00996000-00aac000	r-xp	00000000	03:05	1158770	/lib/tls/libc-2.3.3.so	
00aac000-00aad000	r--p	00116000	03:05	1158770	/lib/tls/libc-2.3.3.so	
00aad000-00ab0000	rw-p	00117000	03:05	1158770	/lib/tls/libc-2.3.3.so	
00ab0000-00ab2000	rw-p	00ab0000	00:00	0		
08048000-08050000	r-xp	00000000	03:05	571452	/sbin/init (text)	
08050000-08051000	rw-p	00008000	03:05	571452	/sbin/init (data, stack)	
08b43000-08b64000	rw-p	08b43000	00:00	0		
f6fdf000-f6fe0000	rw-p	f6fdf000	00:00	0		
fefd4000-ff000000	rw-p	fefd4000	00:00	0		
ffffe000-ffffff00	---p	00000000	00:00	0		

mmap (2)

Particularly useful when the file is a device file!

Allows to access device I/O memory and ports without having to go through (expensive) `read`, `write` or `ioctl` calls!

X server example (maps excerpt)

start	end	perm	offset	major:minor	inode	mapped file name
08047000	-081be000	r-xp	00000000	03:05	310295	/usr/X11R6/bin/Xorg
081be000	-081f0000	rw-p	00176000	03:05	310295	/usr/X11R6/bin/Xorg
...						
f4e08000	-f4f09000	rw-s	e0000000	03:05	655295	/dev/dri/card0
f4f09000	-f4f0b000	rw-s	4281a000	03:05	655295	/dev/dri/card0
f4f0b000	-f6f0b000	rw-s	e8000000	03:05	652822	/dev/mem
f6f0b000	-f6f8b000	rw-s	fcff0000	03:05	652822	/dev/mem

How to implement mmap - User space

- ▶ Open the device file
- ▶ Call the `mmap` system call (see `man mmap` for details):

```
void * mmap(  
    void *start,      /* Often 0, preferred starting address */  
    size_t length,   /* Length of the mapped area */  
    int prot ,       /* Permissions: read, write, execute */  
    int flags,       /* Options: shared mapping, private copy... */  
    int fd,          /* Open file descriptor */  
    off_t offset     /* Offset in the file */  
);
```

- ▶ Read from the return virtual address or write to it.

How to implement mmap - Kernel space

- ▶ Character driver: implement a `mmap` file operation and add it to the driver file operations:

```
int (*mmap) (  
    struct file *,           /* Open file structure */  
    struct vm_area_struct   /* Kernel VMA structure */  
);
```

- ▶ Initialize the mapping.

Can be done in most cases with the `remap_pfn_range()` function, which takes care of most of the job.

remap_pfn_range()

- ▶ *pfn*: page frame number

The most significant bits of the page address
(without the bits corresponding to the page size).

- ▶ `#include <linux/mm.h>`

```
int remap_pfn_range(  
    struct vm_area_struct *,           /* VMA struct */  
    unsigned long virt_addr,          /* Starting user virtual address */  
    unsigned long pfn,                /* pfn of the starting physical address */  
    unsigned long size,               /* Mapping size */  
    pgprot_t                          /* Page permissions */  
);
```

Simple mmap implementation

```
static int acme_mmap (  
    struct file * file, struct vm_area_struct * vma)  
{  
    size = vma->vm_start - vma->vm_end;  
  
    if (size > ACME_SIZE)  
        return -EINVAL;  
  
    if (remap_pfn_range(vma,  
                        vma->vm_start,  
                        ACME_PHYS >> PAGE_SHIFT,  
                        size,  
                        vma->vm_page_prot))  
        return -EAGAIN;  
    return 0;  
}
```

devmem2

<http://free-electrons.com/pub/mirror/devmem2.c>, by Jan-Derk Bakker

Very useful tool to directly peek (read) or poke (write) I/O addresses mapped in physical address space from a shell command line!

- ▶ Very useful for early interaction experiments with a device, without having to code and compile a driver.

- ▶ Uses `mmap` to `/dev/mem`.

Need to run `request_mem_region` and setup `/dev/mem` first.

- ▶ Examples (**b**: byte, **h**: half, **w**: word)

```
devmem2 0x000c0004 h (reading)
```

```
devmem2 0x000c0008 w 0xffffffff (writing)
```

Embedded Linux driver development

Driver development DMA

DMA situations

Synchronous

- ▶ A user process calls the read method of a driver. The driver allocates a DMA buffer and asks the hardware to copy its data. The process is put in sleep mode.
- ▶ The hardware copies its data and raises an interrupt at the end.
- ▶ The interrupt handler gets the data from the buffer and wakes up the waiting process.

Asynchronous

- ▶ The hardware sends an interrupt to announce new data.
- ▶ The interrupt handler allocates a DMA buffer and tells the hardware where to transfer data.
- ▶ The hardware writes the data and raises a new interrupt.
- ▶ The handler releases the new data, and wakes up the needed processes.

Memory constraints

- ▶ Need to use contiguous memory in physical space
- ▶ Can use any memory allocated by `kmalloc` (up to 128 KB) or `__get_free_pages` (up to 8MB)
- ▶ Can use block I/O and networking buffers, designed to support DMA.
- ▶ Can **not** use `vmalloc` memory (would have to setup DMA on each individual page)

Reserving memory for DMA

To make sure you've got enough RAM for big DMA transfers...

Example assuming you have 32 MB of RAM, and need 2 MB for DMA:

- ▶ Boot your kernel with `mem=30`

The kernel will just use the first 30 MB of RAM.

- ▶ Driver code can now reclaim the 2 MB left:

```
dmabuf = ioremap (  
    0x1e00000,           /* Start: 30 MB */  
    0x200000           /* Size: 2 MB */  
);
```

Memory synchronization issues

Memory caching could interfere with DMA

▶ Before DMA to device:

Need to make sure that all writes to DMA buffer are committed.

▶ After DMA from device:

Before drivers read from DMA buffer, need to make sure that memory caches are flushed.

▶ Bidirectional DMA

Need to flush caches before and after the DMA transfer.

Linux DMA API

The kernel DMA utilities can take care of:

- ▶ Either allocating a buffer in a cache coherent area,
- ▶ Or make sure caches are flushed when required,
- ▶ Managing the DMA mappings and IOMMU (if any)
- ▶ See [Documentation/DMA-API.txt](#) for details about the Linux DMA generic API.
- ▶ Most subsystems (such as PCI or USB) supply their own DMA API, derived from the generic one. May be sufficient for most needs.

Limited DMA address range?

- ▶ By default, the kernel assumes that your device can DMA to any 32 bit address. Not true for all devices!
- ▶ To tell the kernel that it can only handle 24 bit addresses:

```
if (dma_set_mask (dev,          /* device structure */
                  0xffffffff    /* 24 bits */
                  ))
    use_dma = 1;                /* Able to use DMA */
else
    use_dma = 0;                /* Will have to do without DMA */
```

Coherent or streaming DMA mappings

- ▶ Coherent mappings

Can simultaneously be accessed by the CPU and device.

So, have to be in a cache coherent memory area.

Usually allocated for the whole time the module is loaded.

Can be expensive to setup and use.

- ▶ Streaming mappings (recommended)

Set up for each transfer.

Keep DMA registers free on the physical hardware registers.

Some optimizations also available.

Allocating coherent mappings

The kernel takes care of both the buffer allocation and mapping:

```
include <asm/dma-mapping.h>
```

```
void *                               /* Output: buffer address */  
    dma_alloc_coherent(  
        struct device *dev, /* device structure */  
        size_t size,        /* Needed buffer size in bytes */  
        dma_addr_t *handle, /* Output: DMA bus address */  
        gfp_t gfp           /* Standard GFP flags */  
    );
```

```
void dma_free_coherent(struct device *dev,  
    size_t size, void *cpu_addr, dma_addr_t handle);
```

DMA pools (1)

- ▶ `dma_alloc_coherent` usually allocates buffers with `__get_free_pages` (minimum: 1 page).
- ▶ You can use DMA pools to allocate smaller coherent mappings:

```
<include linux/dmapool.h>
```

- ▶ Create a dma pool:

```
struct dma_pool *  
dma_pool_create (  
    const char *name,           /* Name string */  
    struct device *dev,        /* device structure */  
    size_t size,               /* Size of pool buffers */  
    size_t align,              /* Hardware alignment (bytes) */  
    size_t allocation           /* Address boundaries not to be crossed */  
);
```

DMA pools (2)

- ▶ Allocate from pool

```
void * dma_pool_alloc (  
    struct dma_pool *pool,  
    gfp_t mem_flags,  
    dma_addr_t *handle  
);
```

- ▶ Free buffer from pool

```
void dma_pool_free (  
    struct dma_pool *pool,  
    void *vaddr,  
    dma_addr_t dma);
```

- ▶ Destroy the pool (free all buffers first!)

```
void dma_pool_destroy (struct dma_pool *pool);
```

Setting up streaming mappings

Works on buffers **already allocated by the driver**

```
<include linux/dmapool.h>

dma_addr_t dma_map_single(
    struct device *,                /* device structure */
    void *,                          /* input: buffer to use */
    size_t,                          /* buffer size */
    enum dma_data_direction /* Either DMA_BIDIRECTIONAL,
                               DMA_TO_DEVICE or DMA_FROM_DEVICE */
);

void dma_unmap_page(struct device *dev, dma_addr_t
    handle, size_t size, enum dma_data_direction dir);
```

DMA streaming mapping notes

- ▶ When the mapping is active: only the device should access the buffer (potential cache issues otherwise).
- ▶ The CPU can access the buffer only after unmapping!
- ▶ Another reason: if required, this API can create an intermediate *bounce buffer* (used if the given buffer is not usable for DMA).
- ▶ Possible for the CPU to access the buffer without unmapping it, using the `dma_sync_single_for_cpu()` (ownership to cpu) and `dma_sync_single_for_device()` functions (ownership back to device).
- ▶ The Linux API also support scatter / gather DMA streaming mappings.

Embedded Linux driver development

Driver development New Device Model

Device Model features (1)

- ▶ Originally created to make power management simpler
Now goes much beyond.
- ▶ Used to represent the architecture and state of the system
- ▶ Has a representation in userspace: `sysfs`
Now the preferred interface with userspace (instead of `/proc`)
- ▶ Easy to implement thanks to the device interface:
`include/linux/device.h`

Device model features (2)

Allows to view the system for several points of view:

- ▶ From devices existing in the system: their power state, the bus they are attached to, and the driver responsible for them.
- ▶ From the system bus structure: which bus is connected to which bus (e.g. USB bus controller on the PCI bus), existing devices and devices potentially accepted (with their drivers)
- ▶ From available device drivers: which devices they can support, and which bus type they know about.
- ▶ From the various kinds ("classes") of devices: **input**, **net**, **sound**... Existing devices for each class. Convenient to find all the input devices without actually knowing how they are physically connected.

sysfs

- ▶ Userspace representation of the Device Model.
- ▶ Configure it with
`CONFIG_SYSFS=y` (Filesystems -> Pseudo filesystems)
- ▶ Mount it with
`mount -t sysfs none /sys`
- ▶ Spend time exploring `/sys` on your workstation!

sysfs tools

<http://linux-diag.sourceforge.net/Sysfsutils.html>

- ▶ **libsysfs** - The library's purpose is to provide a consistent and stable interface for querying system device information exposed through **sysfs**. Used by **udev** (see later)
- ▶ **systool** - A utility built upon **libsysfs** that lists devices by bus, class, and topology.

The device structure

Declaration

- ▶ The base data structure is `struct device`, defined in `include/linux/device.h`
- ▶ In real life, you will rather use a structure corresponding to the bus your device is attached to: `struct pci_dev`, `struct usb_device`...

Registration

- ▶ Still depending on the device type, specific register and unregister functions are provided

Device attributes

Defining device attributes to be read/written from/by userspace

```
struct device_attribute {
    struct attribute      attr;
    ssize_t (*show)(struct device * dev, char * buf, size_t count, loff_t off);
    ssize_t (*store)(struct device * dev, const char * buf, size_t count, loff_t off);
};

#define DEVICE_ATTR(name,mode,show,store)
```

Adding / removing from the device directory

```
int device_create_file(struct device *device, struct device_attribute * entry);
void device_remove_file(struct device * dev, struct device_attribute * attr);
```

Example

```
/* Creates a file named "power" with a 0644 (-rw-r--r--) mode */

DEVICE_ATTR(power,0644,show_power,store_power);
device_create_file(dev,&dev_attr_power);
device_remove_file(dev,&dev_attr_power);
```

The device driver structure

Declaration

```
struct device_driver {
    /* Omitted a few internals */
    char          *name;
    struct bus_type *bus;
    int          (*probe)      (struct device * dev);
    int          (*remove)     (struct device * dev);
    void         (*shutdown)   (struct device * dev);
    int          (*suspend)    (struct device * dev, u32 state, u32 level);
    int          (*resume)     (struct device * dev, u32 level);
};
```

Registration

```
extern int driver_register(struct device_driver * drv);
extern void driver_unregister(struct device_driver * drv);
```

Attributes

Available in a similar way

Device Model references

- ▶ Very useful and clear documentation in the kernel sources!
- ▶ `Documentation/driver-model/`
- ▶ `Documentation/filesystems/sysfs.txt`

Embedded Linux driver development

Driver development hotplug

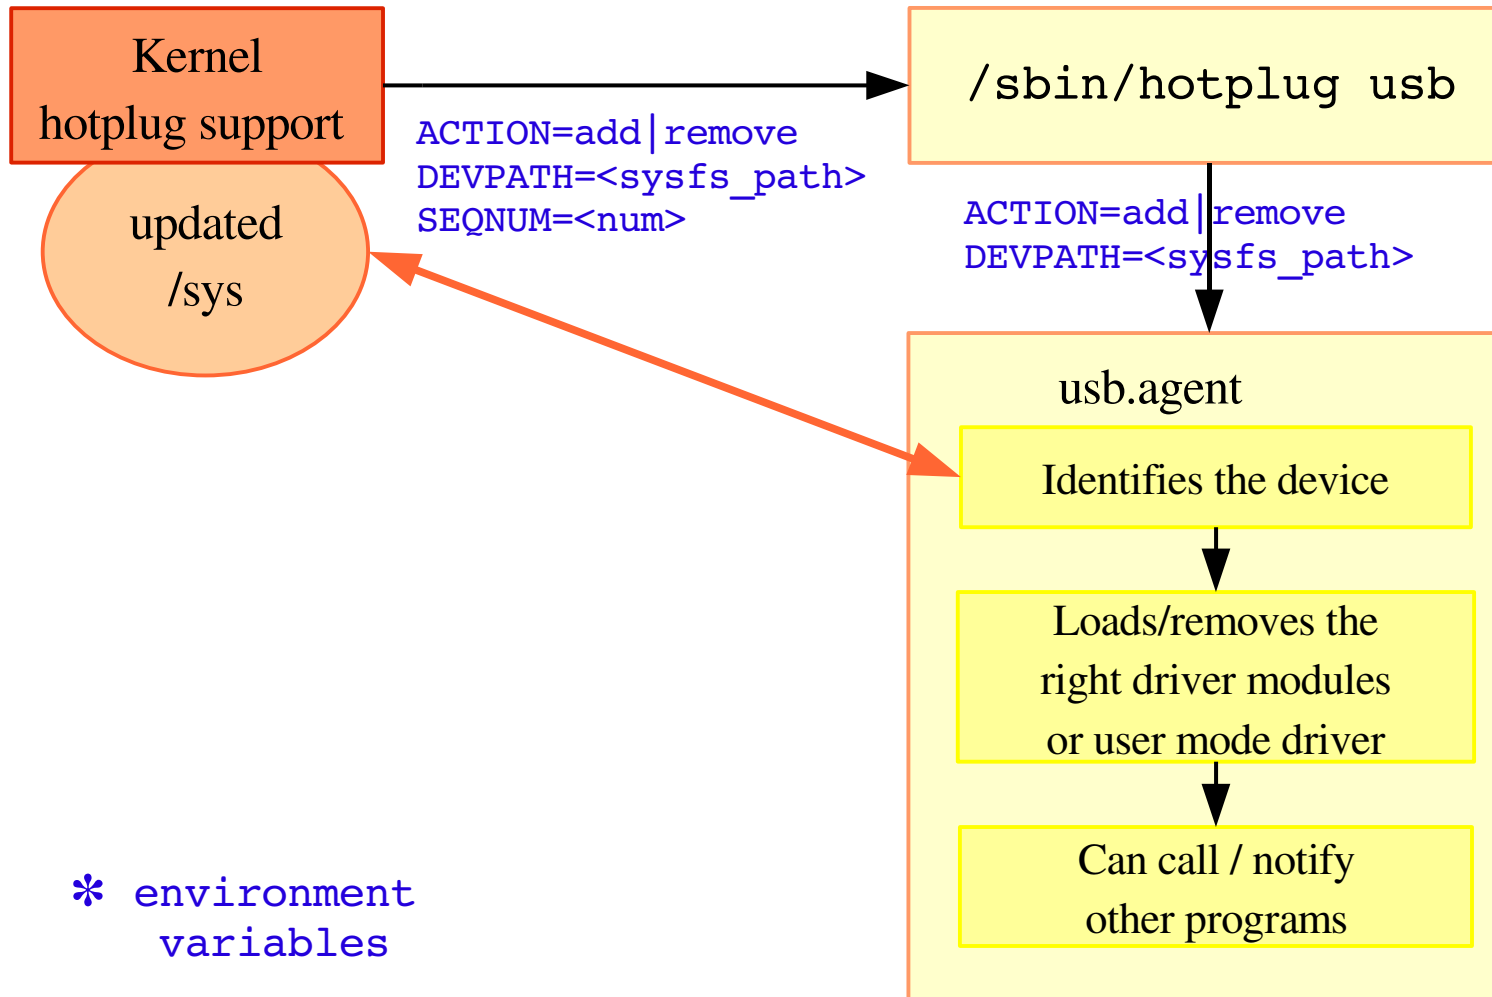

hotplug overview

- ▶ Introduced in Linux 2.4. Pioneered by USB.
- ▶ Kernel mechanism to notify user space programs that a device has been inserted or removed.
- ▶ User space scripts then take care of identifying the hardware and inserting/removing the right driver modules.
- ▶ Linux 2.6: much easier device identification thanks to `sysfs`
- ▶ Makes it possible to load external firmware
- ▶ Makes it possible to have user-mode only driver (e.g. `libsane`)
- ▶ Kernel configuration:
`CONFIG_HOTPLUG=y` (General setup section)

hotplug flow example

* environment variables

hotplug files

`/lib/modules/*/modules.*map`
depmod output

`/proc/sys/kernel/hotplug`
specifies hotplug program path

`/sbin/hotplug`
hotplug program (default path name)

`/etc/hotplug/*`
hotplug files

`/etc/hotplug/NAME*`
subsystem-specific files, for agents

`/etc/hotplug/NAME/DRIVER`
driver setup scripts, invoked by agents

`/etc/hotplug/usb/DRIVER.usermap`
depmod data for user-mode drivers

`/etc/hotplug/NAME.agent`
hotplug subsystem-specific agents

Firmware hotplugging

Reasons for keeping firmware data outside their device drivers

Legal issues

- ▶ Some firmware is not legal to distribute and can't be shipped in a Free Software driver
- ▶ Some firmware may not be considered as free enough to distribute (Debian example)

Technical issues

- ▶ Firmware in kernel code would occupy memory permanently, even if just used once.

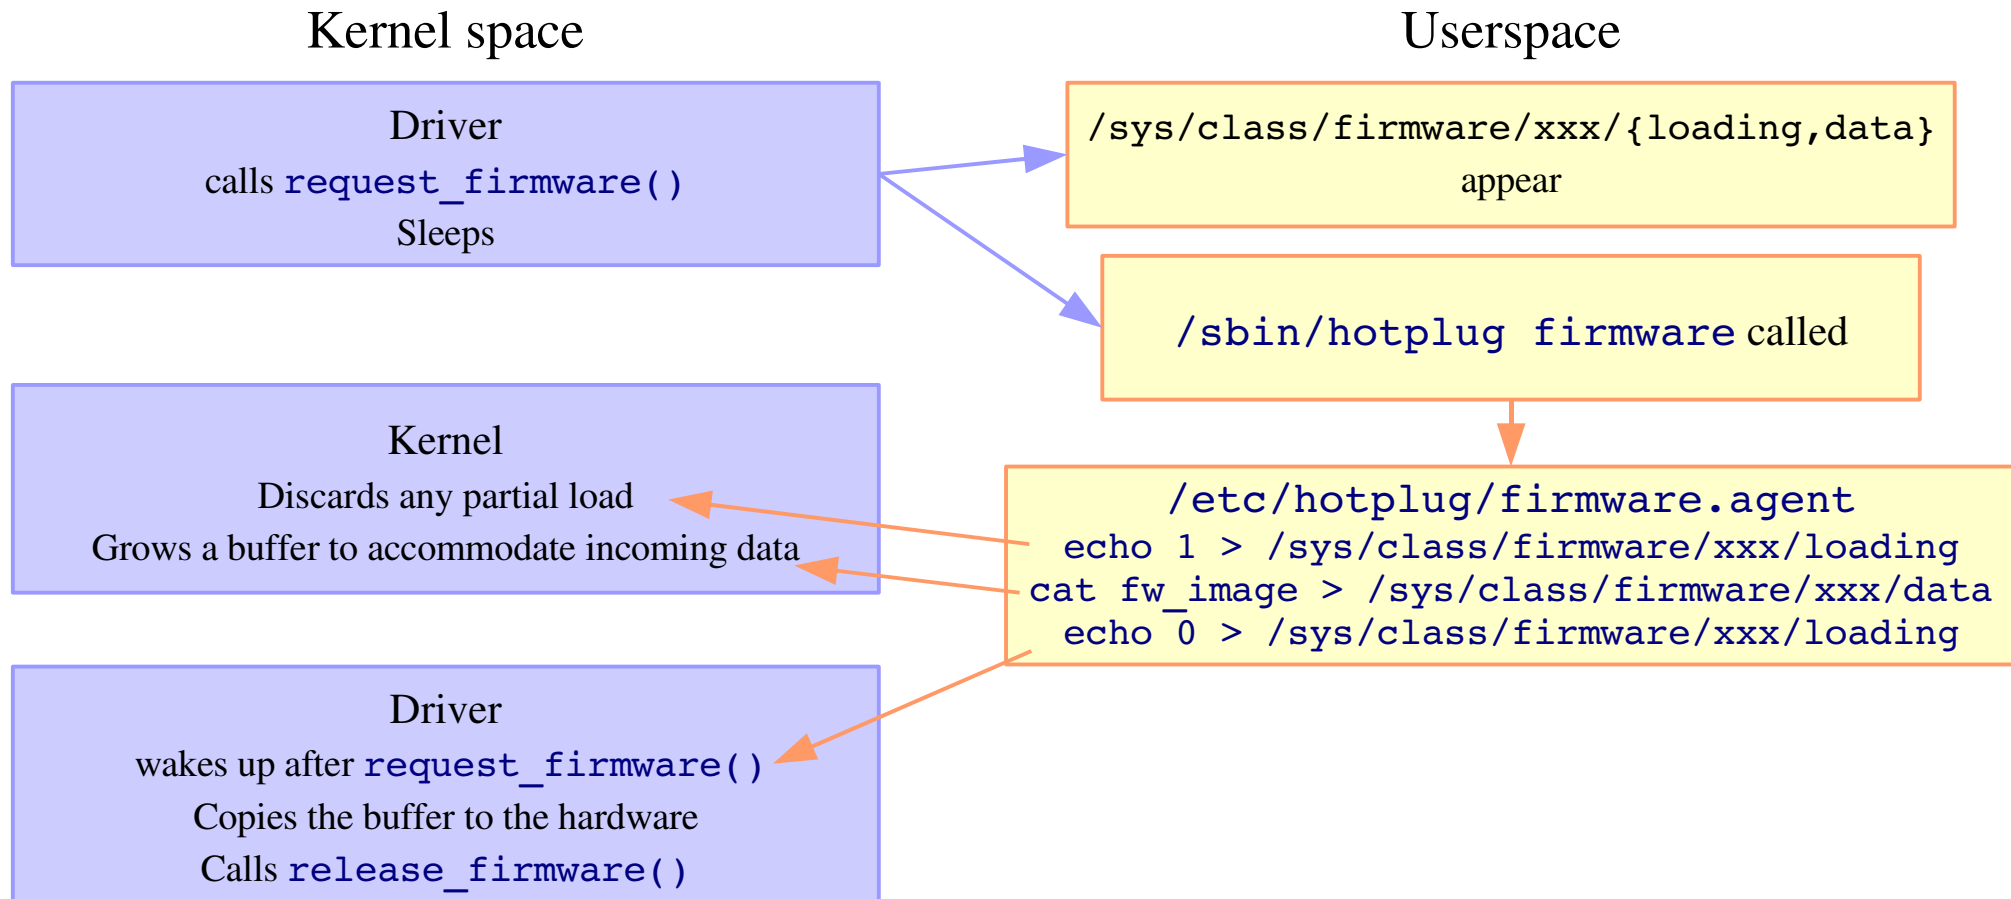

Firmware hotplugging setup

- ▶ Kernel configuration: needs to be set in `CONFIG_FW_LOADER` (Device Drivers -> Generic Driver Options -> hotplug firmware loading support)
- ▶ Need `/sys` to be mounted
- ▶ Location of firmware files: check `/etc/hotplug/firmware.agent`

Firmware hotplugging implementation

See [Documentation/firmware_class/](#) for a nice overview

hotplug references

- ▶ Project page and documentation

<http://linux-hotplug.sourceforge.net/>

- ▶ Mailing list:

<http://lists.sourceforge.net/lists/listinfo/linux-hotplug-devel>

Embedded Linux driver development

Driver development

udev: user-space device file management

/dev issues and limitations

- ▶ On Red Hat 9, 18000 entries in `/dev`!
All entries for all possible devices need to be created at system installation.
- ▶ Need for an authority to assign major numbers
<http://lanana.org/>: Linux Assigned Names and Numbers Authority
- ▶ Not enough numbers in 2.4, limits extended in 2.6
- ▶ Userspace doesn't know what devices are present in the system.
- ▶ Userspace can't tell which `/dev` entry is which device

devfs solutions and limitations

- ▶ Only shows present devices
- ▶ But uses different names as in `/dev`, causing issues in scripts.
- ▶ But no flexibility in device names, unlike with `/dev/`, e.g. the 1st IDE disk device has to be called either `/dev/hda` or `/dev/ide/hd/c0b0t0u0`.
- ▶ But doesn't allow dynamic major and minor number allocation.
- ▶ But requires to store the device naming policy in kernel memory.
Can't be swapped out!

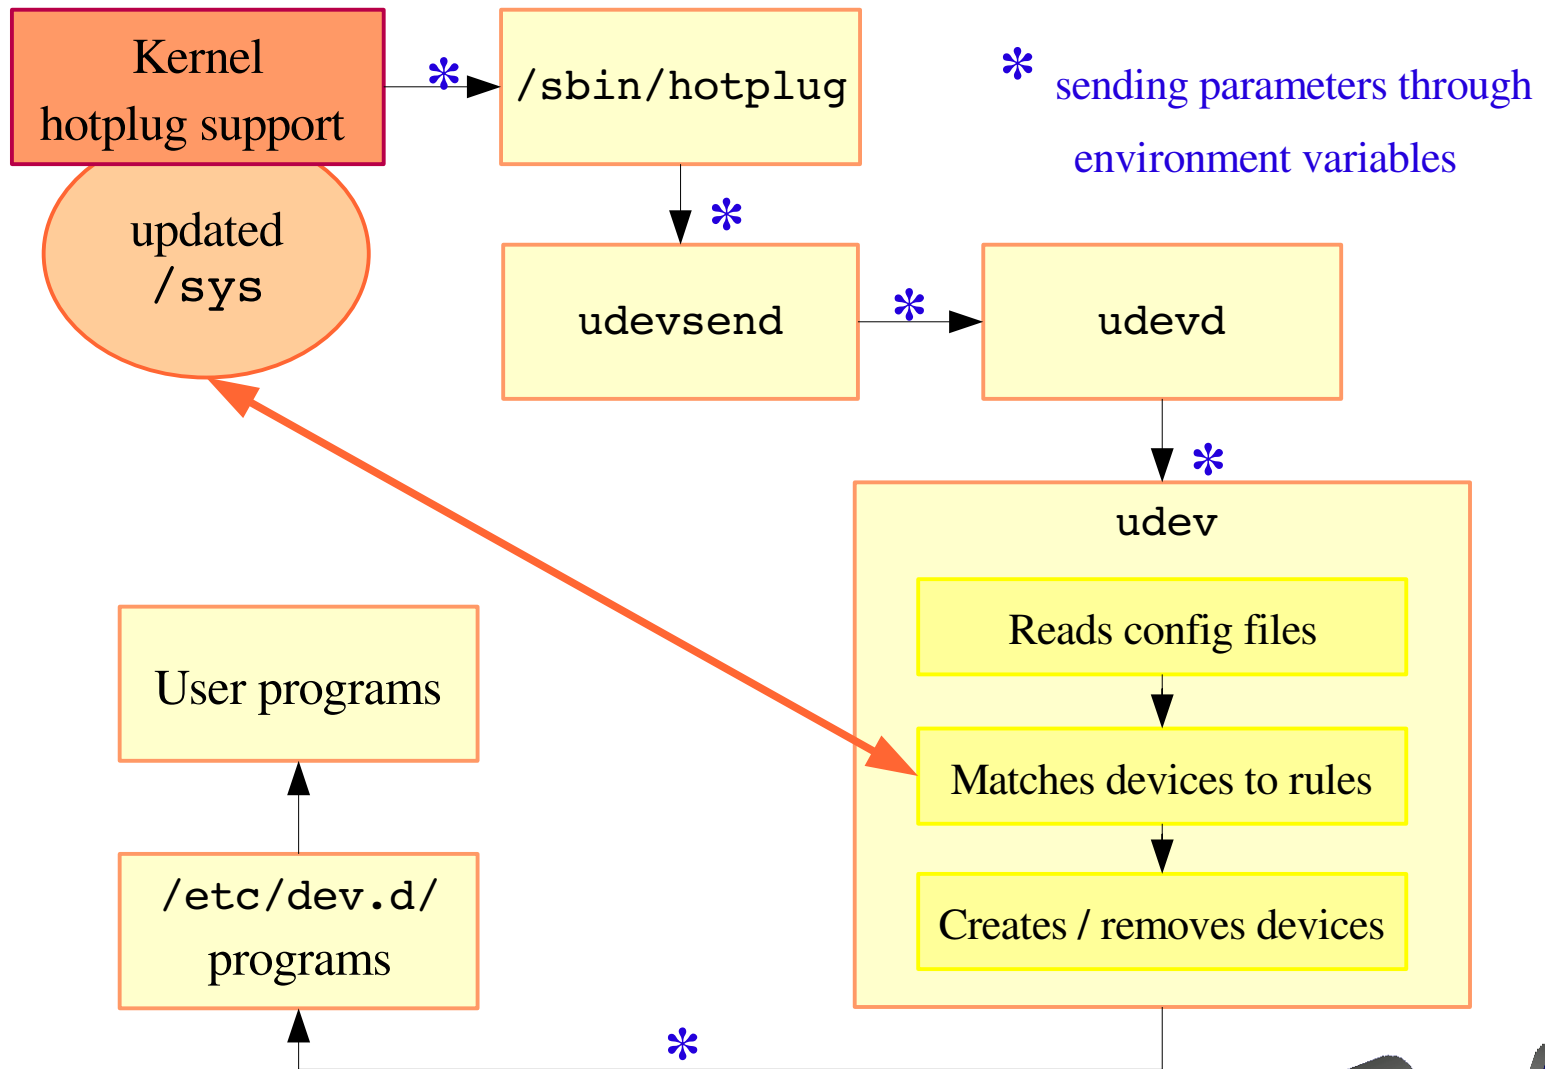

The udev solution

Takes advantage of both `hotplug` and `sysfs`

- ▶ Entirely in user space
- ▶ Automatically creates device entries (by default in `/udev`)
- ▶ Called by `/sbin/hotplug`, uses information from `sysfs`.
- ▶ Major and minor device numbers found in `sysfs`
- ▶ Requires no change to the driver code
- ▶ Small size

How udev works

udev toolset (1)

Major components

- ▶ **udevsend** (8KB in Fedora Core 3)

Takes care of handling the `/sbin/hotplug` events, and sending them to **udev**

- ▶ **udev** (12KB)

Takes care of reordering `hotplug` events, before calling **udev** instances for each of them.

- ▶ **udev** (68KB)

Takes care of creating or removing device entries, entry naming, and then executing programs in `/etc/dev.d/`

udev toolset (2)

Other utilities

- ▶ `udevinfo` (48KB)

Lets users query the `udev` database

- ▶ `udevstart` (functionality brought by `udev`)

Populates the initial device directory from valid devices found in the `sysfs` device tree.

- ▶ `udevtest <sysfs_device_path>` (64KB)

Simulates a `udev` run to test the configured rules

udev configuration file

`/etc/udev/udev.conf`

Easy to edit and configure. Sets the below parameters:

- ▶ Device directory (`/udev`)
- ▶ `udev` database file (`/dev/.udev.tdb`)
- ▶ `udev` rules (`/etc/udev/rules.d/`)
`udev` permissions (`/etc/udev/permissions.d/`)
- ▶ default mode (`0600`), default owner (`root`) and group (`root`), when not found in `udev`'s permissions.
- ▶ Enable logging (`yes`)
Debug messages available in `/var/log/messages`

udev naming capabilities

Device names can be defined

- ▶ from a label or serial number
- ▶ from a bus device number
- ▶ from a location on the bus topology
- ▶ from a kernel name

udev can also create device links

udev rules file example

```
# if /sbin/scsi_id returns "OEM 0815" device will be called disk1
BUS="scsi", PROGRAM="/sbin/scsi_id", RESULT="OEM 0815", NAME="disk1"

# USB printer to be called lp_color
BUS="usb", SYSFS{serial}="W09090207101241330", NAME="lp_color"

# SCSI disk with a specific vendor and model number will be called boot
BUS="scsi", SYSFS{vendor}="IBM", SYSFS{model}="ST336", NAME="boot%n"

# sound card with PCI bus id 00:0b.0 to be called dsp
BUS="pci", ID="00:0b.0", NAME="dsp"

# USB mouse at third port of the second hub to be called mouse1
BUS="usb", PLACE="2.3", NAME="mouse1"

# ttyUSB1 should always be called pda with two additional symlinks
KERNEL="ttyUSB1", NAME="pda", SYMLINK="palmtop handheld"

# multiple USB webcams with symlinks to be called webcam0, webcam1, ...
BUS="usb", SYSFS{model}="XV3", NAME="video%n", SYMLINK="webcam%n"
```

udev sample permissions

Sample `udev` permission file (in `/etc/udev/permissions.d/`):

```
#name:user:group:mode
input/*:root:root:644
ttyUSB1:0:8:0660
video*:root:video:0660
dsp1:::0666
```

/etc/dev.d/

After device nodes are created, removed or renamed, `udev` can call programs found in the below search order:

- ▶ `/etc/dev.d/$(DEVNAME)/*.dev`
- ▶ `/etc/dev.d/$(SUBSYSTEM)/*.dev`
- ▶ `/etc/dev.d/default/*.dev`

The programs in each directory are sorted in lexical order.

This is useful to notify user applications of device changes.

Embedded Linux driver development

Advice and resources

System security

- ▶ In production: disable loadable kernel modules if you can.
- ▶ Carefully check data from input devices (if interpreted by the driver) and from user programs (buffer overflows)
- ▶ Check kernel sources signature.
- ▶ Beware of uninitialized memory.
Sensitive memory: clear it before freeing it.
The same page could later be allocated to a user process.
- ▶ Compile modules by yourself (beware of binary modules)

Embedded Linux driver development

Advice and resources Choosing filesystems

Block device or MTD filesystems

Block devices

- ▶ Floppy or hard disks (SCSI, IDE)
- ▶ Compact Flash (seen as a regular IDE drive)
- ▶ RAM disks
- ▶ Loopback devices

Memory Technology Devices (MTD)

- ▶ Flash, ROM or RAM chips
- ▶ MTD emulation on block devices

Filesystems are either made for block or MTD storage devices.
See [Documentation/filesystems/](#) for details.

Traditional block filesystems

Traditional filesystems

- ▶ Hard to recover from crashes. Can be left in a corrupted (“half finished”) state after a system crash or sudden power-off.
- ▶ **ext2**: traditional Linux filesystem
(repair it with **fsck.ext2**)
- ▶ **vfat**: traditional Windows filesystem
(repair it with **fsck.vfat** on GNU/Linux or **Scandisk** on Windows)

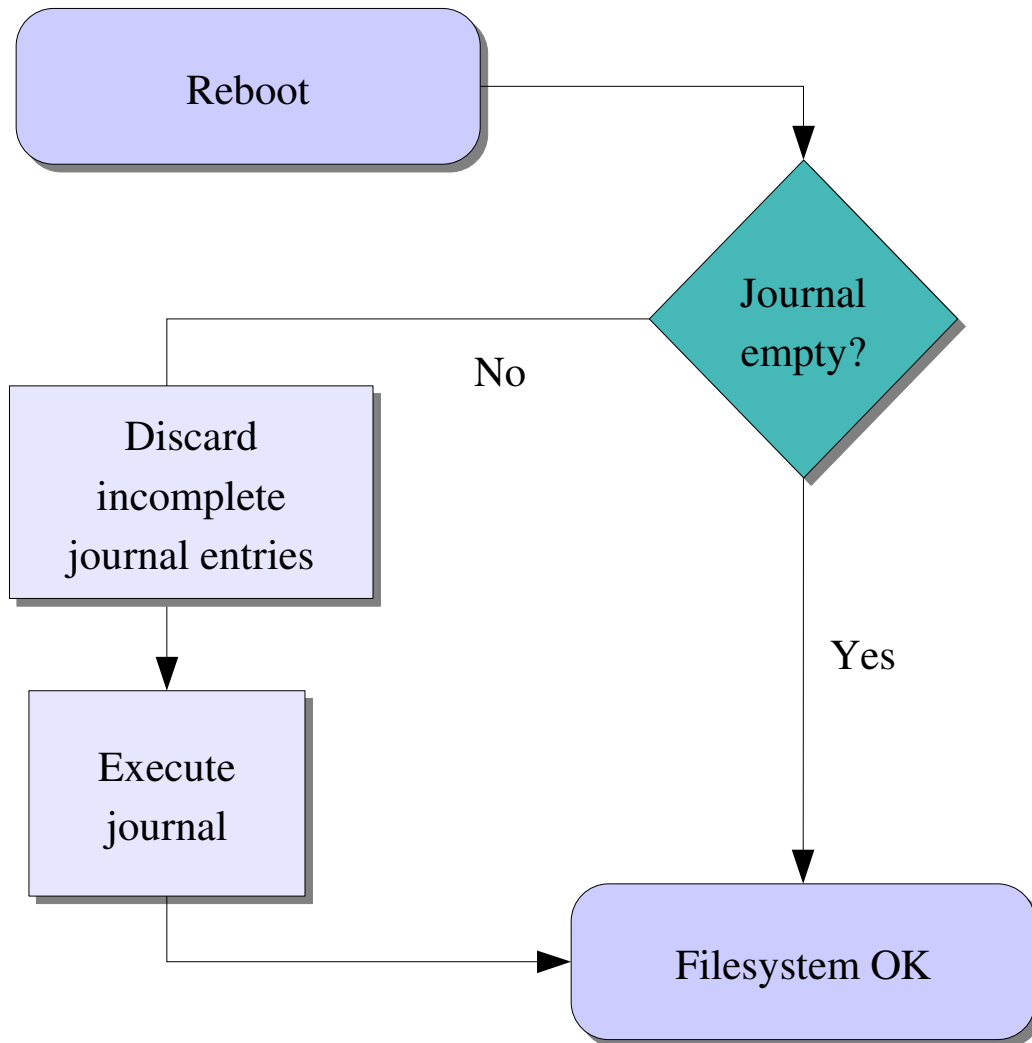

Journalled filesystems

- ▶ Designed to stay in a correct state even after system crashes or a sudden power-off
- ▶ All writes are first described in the journal before being committed to files

Filesystem recovery after crashes

- ▶ Thanks to the journal, the filesystem is never left in a corrupted state
- ▶ Recently saved data could still be lost

Journalled block filesystems

Journalled filesystems

- ▶ **ext3**: **ext2** with journal extension
- ▶ **reiserFS**: most innovative (fast and extensible)
- ▶ Others: **JFS** (IBM), **XFS** (SGI)
- ▶ **NTFS**: well supported by Linux in read-mode

Compressed block filesystems (1)

Cramfs

- ▶ Simple, small, read-only compressed filesystem designed for embedded systems .
- ▶ Maximum filesystem size: 256 MB
- ▶ Maximum file size: 16 MB

See [Documentation/filesystems/cramfs.txt](#) in kernel sources.

Compressed block filesystems (2)

Squashfs: <http://squashfs.sourceforge.net>

- ▶ A must-use replacement for **Cramfs**! Also read-only.
- ▶ Maximum filesystem and file size: 2^{32} bytes (4 GB)
- ▶ Achieves better compression and much better performance.
- ▶ Fully stable but released as a separate patch so far (waiting for Linux 2.7 to start).
- ▶ Successfully tested on **i386**, **ppc**, **arm** and **sparc**.

See benchmarks on

<http://tree.celinuxforum.org/CelfPubWiki/SquashFsComparisons>

ramdisk filesystems

Useful to store temporary data not kept after power off or reboot:
system log files, connection data, temporary files...

- ▶ Traditional block filesystems:

Journaling not needed.

Drawback: fixed in size. Remaining space not usable as RAM.

- ▶ tmpfs (Config: **File systems -> Pseudo filesystems**)

Doesn't waste RAM: grows and shrinks to accommodate stored files

Saves RAM: can swap out pages to disk when needed.

See [Documentation/filesystems/tmpfs.txt](#)
in kernel sources.

Mixing read-only and read-write filesystems

Good idea to split your block storage into

- ▶ A compressed read-only partition (**Squashfs**)
Typically used for the root filesystem (binaries, kernel...).
Compression saves space. Read-only access protects your system from mistakes and data corruption.
- ▶ A read-write partition with a journaled filesystem (like **ext3**)
Used to store user or configuration data.
Guarantees filesystem integrity after power off or crashes.
- ▶ A ramdisk for temporary files (**tmpfs**)

Squashfs
read-only
compressed
root
filesystem

ext3
read-write
user and
configuration
data

tmpfs
read-write
volatile data

Memory devices hardware

MTD filesystems - jffs2

jffs2: Journaling Flash File System v2

- ▶ Designed to write flash sectors in an homogeneous way. Flash bits can only be rewritten a relatively small number of times (often $< 100\ 000$).
- ▶ Compressed to fit as many data as possible on flash chips. Also compensates for slower access time to those chips.
- ▶ Power down reliable: can restart without any intervention
- ▶ Shortcomings: low speed, big RAM consumption (4 MB for 128 MB of storage).

Mounting a jffs2 image

Useful to create or edit `jffs2` images on your GNU / Linux PC!

- ▶ Mounting an MTD device as a loop device is a bit complex task. Here's an example for `jffs2`:

```
modprobe loop
modprobe mtdblock
losetup /dev/loop0 <file>.jffs2
modprobe blkmtt erasesz=256 device=/dev/loop0
mknod /dev/mtdblock0 b 31 0 (if not done yet)
mkdir /mnt/jffs2 (example mount point, if not done yet)
mount -t jffs2 /dev/mtdblock0 /mnt/initrd/
```

- ▶ It's very likely that your standard kernel misses one of these modules. Check the corresponding `.c` file in the kernel sources and look in the corresponding `Makefile` which option you need to recompile your kernel with.

MTD filesystems - yaffs2

yaffs2: Yet Another Flash Filing System, version 2

- ▶ **yaffs2** home: <http://aleph1.co.uk/drupal/?q=node/35>
Caution: site under reconstruction. Lots of broken links!
- ▶ Features: NAND flash only. No compression. Several times faster than **jffs2** (mainly significant in boot time) Consumes much less RAM. Also includes ECC and is power down reliable.
- ▶ License: GPL or proprietary
- ▶ Ships outside the Linux kernel. Get it from CVS:
<http://aleph1.co.uk/cgi-bin/viewcvs.cgi/yaffs/>

Filesystem choices for block flash devices

Typically for Compact Flash storage

- ▶ Can't use `jffs2` or `yaffs2` on CF storage (block device). MTD Block device emulation could be used, but `jffs2` / `yaffs2` writing schemes could interfere with on-chip flash management (manufacturer dependent).

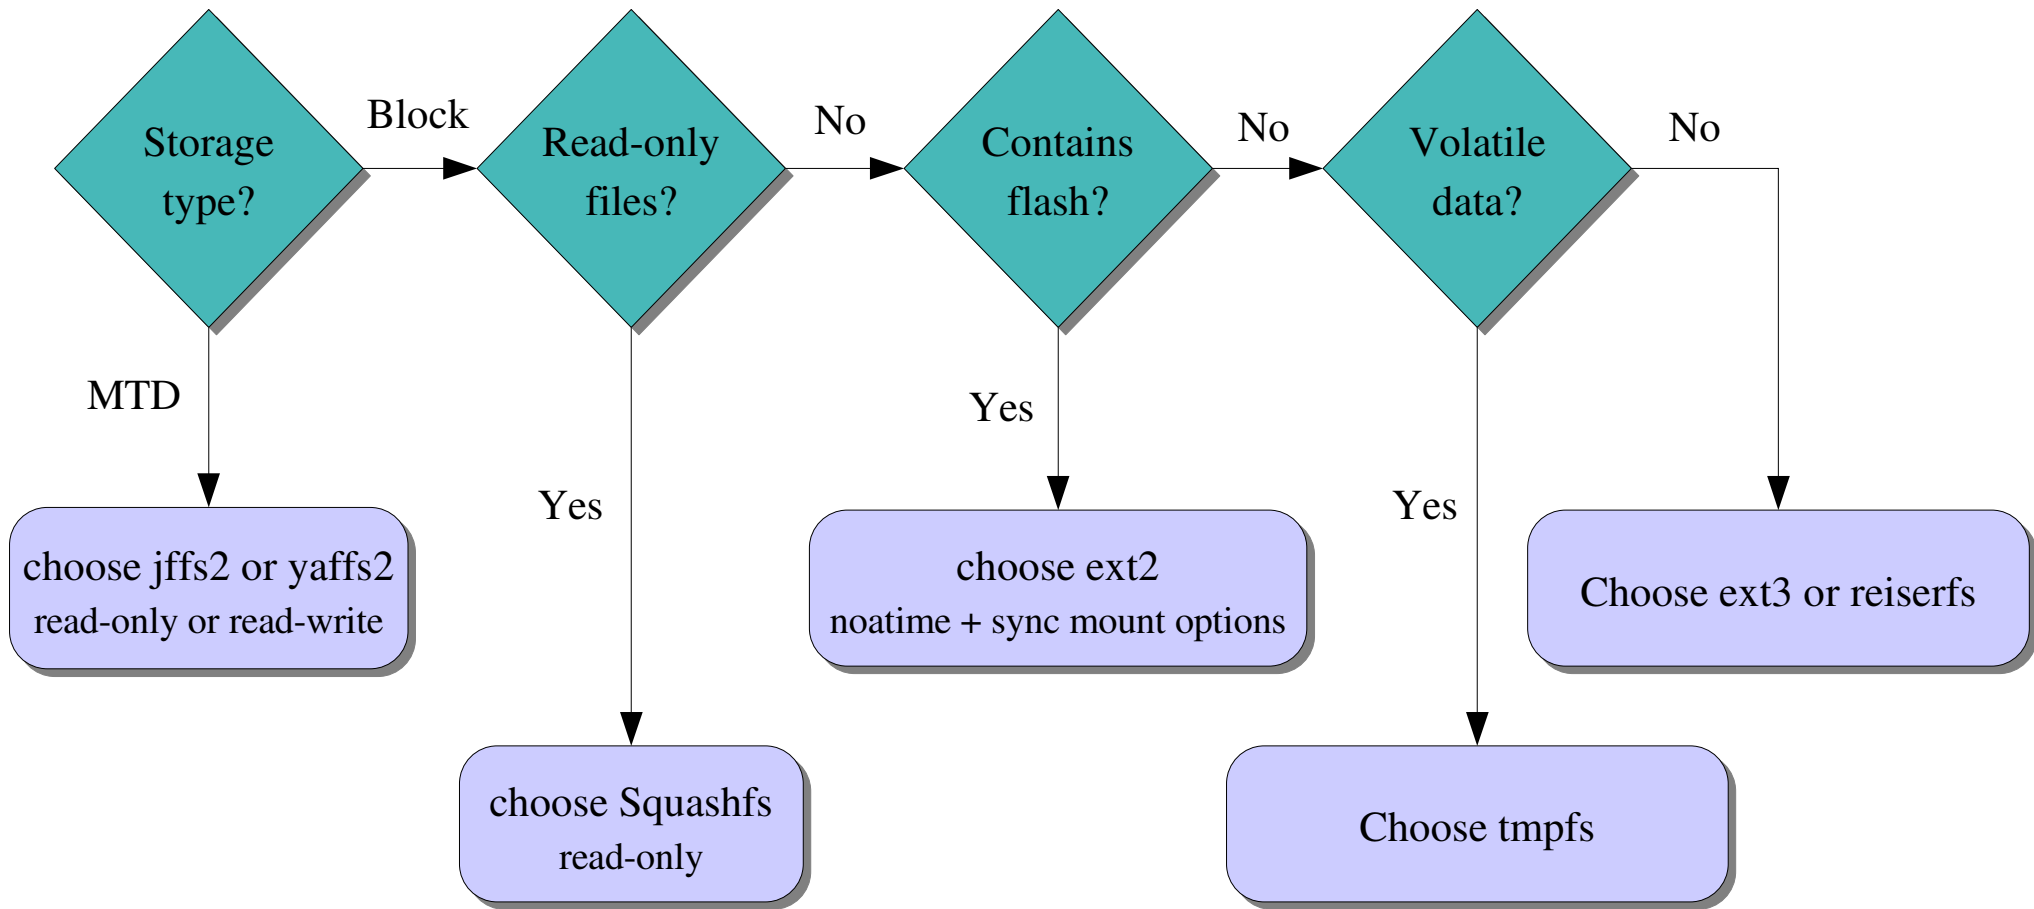

- ▶ **Never use block device journaled filesystems on unprotected flash chips!**
Keeping the journal would write the same sectors over and over again and quickly damage them.

- ▶ Can use `ext2` or `vfat`, with the below mount options:
`noatime`: doesn't write access time information in file inodes
`sync`: to perform writes immediately (reduce power down failure risks)

Filesystem choice summary

Embedded Linux driver development

Advice and resources
Getting help and contributions

Solving issues

- ▶ If you face an issue, and it doesn't look specific to your work but rather to the tools you are using, it is very likely that someone else already faced it.
- ▶ Search the Internet for similar error reports
 - ▶ On web sites or mailing list archives (using a good search engine)
 - ▶ On newsgroups: <http://groups.google.com/>
- ▶ You have great chances of finding a solution or workaround, or at least an explanation for your issue.
- ▶ Otherwise, reporting the issue is up to you!

Getting help

- ▶ If you have a support contract, ask your vendor
- ▶ Otherwise, don't hesitate to share your questions and issues on mailing lists
 - ▶ Either contact the Linux mailing list for your architecture (like linux-arm-kernel or linuxsh-dev...)
 - ▶ Or contact the mailing list for the subsystem you're dealing with (linux-usb-devel, linux-mtd...). Don't ask the maintainer directly!
 - ▶ Most mailing lists come with a FAQ page. Make sure you read it before contacting the mailing list
 - ▶ Refrain from contacting the Linux Kernel mailing list, unless you're an experienced developer and need advice

Getting contributions

Applies if your project can interest other people:
developing a driver or filesystem, porting Linux on a new
processor, board or device available on the market...

External contributors can help you a lot by

- ▶ Testing
- ▶ Writing documentation
- ▶ Making suggestions
- ▶ Even writing code

Encouraging contributions

- ▶ Open your development process: mailing list, Wiki, public CVS read access
- ▶ Let everyone contribute according to their skills and interests.
- ▶ Release early, release often
- ▶ Take feedback and suggestions into account
- ▶ Recognize contributions
- ▶ Make sure status and documentation are up to date
- ▶ Publicize your work and progress to broader audiences

Embedded Linux driver development

Advice and resources
Bug report and patch submission

Reporting Linux bugs

- ▶ First make sure you're using the latest version
- ▶ Make sure you investigate the issue as much as you can:
see [Documentation/BUG-HUNTING](#)
- ▶ Make sure the bug has not been reported yet. Check the Official Linux kernel bug database (<http://bugzilla.kernel.org/>) in particular.
- ▶ If the subsystem you report a bug on has a mailing list, use it. Otherwise, contact the official maintainer (see the [MAINTAINERS](#) file). Always give as many useful details as possible.
- ▶ Or file a new bug in <http://bugzilla.kernel.org/>

How to submit patches or drivers

- ▶ Don't merge patches addressing different issues
- ▶ You should identify and contact the official maintainer for the files to patch.
- ▶ See [Documentation/SubmittingPatches](#) for details. For trivial patches, you can copy the Trivial Patch Monkey.
- ▶ Special subsystems:
 - ▶ ARM platform: it's best to submit your ARM patches to Russell King's patch system:
<http://www.arm.linux.org.uk/developer/patches/>

How to become a kernel developer?

Greg Kroah-Hartman gathered useful references and advice for people interested in contributing to kernel development:

[Documentation/HOWTO](#) (in kernel sources since `2.6.15-rc2`)

Do not miss this very useful document!

Embedded Linux driver development

Advice and resources References

Information sites (1)

Linux Weekly News

<http://lwn.net/>

- ▶ **The** weekly digest off all Linux and free software information sources
- ▶ In depth technical discussions about the kernel
- ▶ Subscribe to finance the editors (\$5 / month)
- ▶ Articles available for non subscribers after 1 week.

Information sites (2)

KernelTrap

<http://kerneltrap.org/>

- ▶ Forum website for kernel developers
- ▶ News, articles, whitepapers, discussions, polls, interviews
- ▶ Perfect if a digest is not enough!

Useful reading (1)

Linux Device Drivers, 3rd edition, Feb 2005

▶ By Jonathan Corbet, Alessandro Rubini, Greg Kroah-Hartman, O'Reilly
<http://www.oreilly.com/catalog/linuxdrive3/>

▶ **Freely available on-line!**

Great companion to the printed book for easy electronic searches!

<http://lwn.net/Kernel/LDD3/> (1 PDF file per chapter)

<http://free-electrons.com/community/kernel/ldd3/> (single PDF file)

A must-have book for Linux device driver writers!

Useful reading (2)

- ▶ Linux Kernel Development, 2nd Edition, Jan 2005

Robert Love, Novell Press

http://rlove.org/kernel_book/

A very synthetic and pleasant way to learn about kernel subsystems (beyond the needs of device driver writers)

- ▶ Understanding the Linux Kernel, 3rd edition, Nov 2005

Daniel P. Bovet, Marco Cesati, O'Reilly

<http://oreilly.com/catalog/understandlk/>

An extensive review of Linux kernel internals, covering Linux 2.6 at last.
Unfortunately, only covers the PC architecture.

Useful reading (3)

▶ Building Embedded Linux Systems, April 2003

Karim Yaghmour, O'Reilly

<http://www.oreilly.com/catalog/belinuxsys/>

Not very fresh, but doesn't depend too much on kernel versions

Useful on-line resources

- ▶ Linux kernel mailing list FAQ

<http://www.tux.org/lkml/>

Complete Linux kernel FAQ

Read this before asking a question to the mailing list

- ▶ Kernel Newbies

<http://kernelnewbies.org/>

Glossaries, articles, presentations, HOWTOs, recommended reading, useful tools for people getting familiar with Linux kernel or driver development.

CE Linux Forum resources

CE Linux Forum

CE Linux Forum's Wiki

is full of useful resources for embedded systems developers:

- ▶ Kernel patches not available in mainstream yet
- ▶ Many howto documents of all kinds
- ▶ Details about ongoing projects, such as reducing kernel size, boot time, or power consumption.
- ▶ Contributions are welcome!

<http://tree.celinuxforum.org/CelfPubWiki>

ARM resources

ARM Linux project: <http://www.arm.linux.org.uk/>

▶ Developer documentation:

<http://www.arm.linux.org.uk/developer/>

▶ arm-linux-kernel mailing list:

<http://lists.arm.linux.org.uk/mailman/listinfo/linux-arm-kernel>

▶ FAQ: <http://www.arm.linux.org.uk/armlinux/mlfaq.php>

▶ How to post kernel fixes:

<http://www.arm.uk.linux.org/developer/patches/>

ARMLinux @ Simtec: <http://armlinux.simtec.co.uk/>

A few useful resources: FAQ, documentation and Who's who!

International conferences (1)

Useful conferences featuring Linux kernel presentations

- ▶ Ottawa Linux Symposium (July): <http://linuxsymposium.org/>

Right after the (private) kernel summit.

Lots of kernel topics. Many core kernel hackers still present.

- ▶ Fosdem: <http://fosdem.org> (Brussels, February)

For developers. Kernel presentations from well-known kernel hackers.

- ▶ CE Linux Forum: <http://celinuxforum.org/>

Organizes several international technical conferences, in particular in California (San Jose) and in Japan. Now open to non CELF members!
Very interesting kernel topics for embedded systems developers.

International conferences (2)

- ▶ linux.conf.au (Australia / New Zealand)

Features a few presentations by key kernel hackers.

- ▶ Linux Kongress (Germany, September / October)

<http://www.linux-kongress.org/>

Lots of presentations on the kernel but very expensive registration fees.

Embedded Linux driver development

Advice and resources
Last advice

Use the Source, Luke!

Many resources and tricks on the Internet find you will, but solutions to all technical issues only in the Source lie.

Thanks to LucasArts

Embedded Linux driver development

Annexes

Using Ethernet over USB

Ethernet over USB (1)

If your device doesn't have Ethernet connectivity, but has a USB device controller

- ▶ You can use Ethernet over USB through the `g_ether` USB device (“gadget”) driver (`CONFIG_USB_GADGET`)
- ▶ Of course, you need a working USB device driver. Generally available as more and more embedded processors (well supported by Linux) have a built-in USB device controller
- ▶ Plug-in both ends of the USB cable

Ethernet over USB (2)

- ▶ On the PC host, you need to have the `usbnet` module (`CONFIG_USB_USBNET`)
- ▶ Plug-in both ends of the USB cable. Configure both ends as regular networking devices. Example:
 - ▶ On the target device

```
modprobe g_ether
ifconfig usb0 192.168.0.202
route add 192.168.0.200 dev usb0
```
 - ▶ On the PC

```
modprobe usbnet
ifconfig usb0 192.168.0.200
route add 192.168.0.202 dev usb0
```
- ▶ Works great on iPAQ PDAs!

Embedded Linux driver development

Annexes Init runlevels

System V init runlevels (1)

- ▶ Introduced by System V Unix
Much more flexible than in BSD
- ▶ Make it possible to start or stop different services for each runlevel
- ▶ Correspond to the argument given to `/sbin/init`.
- ▶ Runlevels defined in `/etc/inittab`.

`/etc/inittab` excerpt:

```
id:5:initdefault:

# System initialization.
si::sysinit:/etc/rc.d/rc.sysinit

10:0:wait:/etc/rc.d/rc 0
11:1:wait:/etc/rc.d/rc 1
12:2:wait:/etc/rc.d/rc 2
13:3:wait:/etc/rc.d/rc 3
14:4:wait:/etc/rc.d/rc 4
15:5:wait:/etc/rc.d/rc 5
16:6:wait:/etc/rc.d/rc 6
```

System V init runlevels (2)

Standard levels

- ▶ `init 0`
Halt the system
- ▶ `init 1`
Single user mode for maintenance
- ▶ `init 6`
Reboot the system
- ▶ `init S`
Single user mode for maintenance.
Mounting only /. Often identical to 1

Customizable levels: 2, 3, 4, 5

- ▶ `init 3`
Often multi-user mode, with only
command-line login
- ▶ `init 5`
Often multi-user mode, with
graphical login

init scripts

According to `/etc/inittab` settings, `init <n>` runs:

- ▶ First `/etc/rc.d/rc.sysinit` for all runlevels
- ▶ Then scripts in `/etc/rc<n>.d/`
- ▶ Starting services (`1, 3, 5, S`):
runs `S*` scripts with the `start` option
- ▶ Killing services (`0, 6`):
runs `K*` scripts with the `stop` option
- ▶ Scripts are run in file name lexical order
Just use `ls -l` to find out the order!

/etc/init.d

- ▶ Repository for all available init scripts
- ▶ `/etc/rc<n>.d/` only contains links to the `/etc/init.d/` scripts needed for runlevel `n`
- ▶ `/etc/rc1.d/` example (from Fedora Core 3)

```
K01yum -> ../init.d/yum
K02cups-config-daemon -> ../init.d/cups-
config-daemon
K02haldaemon -> ../init.d/haldaemon
K02NetworkManager ->
../init.d/NetworkManager
K03messagebus -> ../init.d/messagebus
K03rhnsd -> ../init.d/rhnsd
K05anacron -> ../init.d/anacron
K05atd -> ../init.d/atd
```

```
S00single -> ../init.d/single
S01sysstat -> ../init.d/sysstat
S06cpuspeed -> ../init.d/cpuspeed
```

Handling init scripts by hand

Simply call the `/etc/init.d` scripts!

▶ `/etc/init.d/sshd start`

Starting sshd: [OK]

▶ `/etc/init.d/nfs stop`

Shutting down NFS mountd: [FAILED]

Shutting down NFS daemon:

[FAILED] Shutting down NFS quotas:

[FAILED]

Shutting down NFS services: [OK]

▶ `/etc/init.d/pcmcia status`

cardmgr (pid 3721) is running...

▶ `/etc/init.d/httpd restart`

Stopping httpd: [OK]

Starting httpd: [OK]

Training labs

Training labs are also available from the same location:

<http://free-electrons.com/training/drivers>

They are a useful complement to consolidate what you learned from this training. They don't tell *how* to do the exercises.

However, they only rely on notions and tools introduced by the lectures.

If you happen to be stuck with an exercise, this proves that you missed something in the lectures and have to go back to the slides to find what you're looking for.

Related documents

This document belongs to the more than 1000 page materials of an embedded GNU / Linux training from Free Electrons, available under a free documentation license.

How to help

If you support this work, you can help ...

- ▶ By sending corrections, suggestions, contributions and translations
- ▶ By asking your organization to order training sessions performed by the author of these documents (see <http://free-electrons.com/training>)
- ▶ By speaking about it to your friends, colleagues and local Free Software community.
- ▶ By adding links to our on-line materials on your website, to increase their visibility in search engine results.

Thanks

- ▶ To the OpenOffice.org project, for their presentation and word processor tools which satisfied all my needs
- ▶ To <http://openclipart.org> project contributors for their nice public domain clipart
- ▶ To the Handhelds.org community, for giving me so much help and so many opportunities to help.
- ▶ To the members of the whole Free Software and Open Source community, for sharing the best of themselves: their work, their knowledge, their friendship.
- ▶ To Bill Gates, for leaving us with so much room for innovation!

To people who helped, sent corrections or suggestions:

Vanessa Conchodon,
Stéphane Rubino, Samuli Jarvinen, Phil Blundell,
Jeffery Huang, Mohit Mehta, Matti Aaltonen.
